Preface

It is a great pleasure to write this preface to the 2018 Government Competitiveness Report. This sixth-annual version of our report includes systematic indicators measuring Government Competitiveness (GC) using a great variety of data. In this edition, we focus our attention on providing countries regardless of their OECD or non-OECD status with the vital information about their level of Government Competitiveness, which reflects their major domestic concerns and significant international changes triggered by the unprecedented events in recent years: the collapse of postwar liberalism, the massive refugee crisis, strongman politics, and U.S.-China trade war.

Both developed and developing countries are confronted with unrelenting and various pressures and challenges within and beyond their boundaries. First, political turbulence characterizes many of the challenges OECD countries are faced with. Furthermore, the postwar liberal order is starting to crack. The massive number of refugees, forced to abandon their homes due to political turmoil, brutal civil wars, and religious persecution, have crossed borders to enter European countries, the United States, and other developed countries. The massive influx of

migrants has become a significant social burden upon host countries. Also, people in developed countries are showing rising anti-immigrant sentiment because of the perceived social problems caused by immigrants.

Far-right political parties have for several years been gaining influence in Europe, particularly due to the rising number of refugees.. Also, the refugee crisis is problematic to the origin countries of migrants in Africa, the Middle East, the Northern Triangle and Asia. The massive population outflows from developing countries means that these countries are still extremely unstable because of their social problems: political, ethnic and religion conflicts, civil wars, and famines.

The relationship between the U.S. and China had been relatively consistent for 40 years because the U.S. had believed that China's opening up and its fast-growing economy would make China head towards democracy. Also, both the U.S. and China did not want cold war-style hostility, which would deal a severe blow to both economies and international stability. However, their relationship is rapidly changing unlike ever before.

In both OECD and non-OECD countries, right-wing politics with strongman leadership is becoming a current political trend. In other words, an authoritarian and macho style of leadership is back in fashion: U.S. President Trump, Xi Jinping in China; Rodrigo Duterte in the Philippines; Mohammed bin Salman in Saudi Arabia; Viktor Orban in Hungary; Vladimir Putin in Russia; and Recep Tayyip Erdogan in Turkey all fit this type to some extent.

The issues discussed above are not easy to handle and are unlikely to disappear anytime soon. In the middle of unprecedented and daunting challenges, the most important and urgent task for most countries is to clearly recognize “what they can do” and “what they must do” for their survival and a better future. In order to identify these strategies, it is important to know their own strengths and weaknesses based on a systematic approach.

We believe a particular strength of the Government Competitiveness report lies in this systematic approach. We emphasize the roles of government based on systems theory in diverse policy fields within each country as well as across countries. The 2018 Government Competitiveness Report consists of three parts.

In the first section, we start by providing an overview of OECD and Non-OECD countries. We then move onto a brief introductory explanation of our GC concept, research methodology and data sources. The second part includes a series of country-

focused case studies on a number of countries. This year, our team has carefully selected twelve countries and made concerted efforts to provide an in-depth assessment of their government competitiveness. Furthermore, we focus on Korea’s government competitiveness from various angles as a special section of this part. In the last part, we provide the GC result of (1) OECD member-states and (2) non-OECD countries as well as scores for each sub-dimension of Competitiveness.

As mentioned above, we believe that our annual report provides all countries included in this report with useful information to devise necessary strategies for improving their competitiveness. Furthermore, we hope this report will be used widely as a good and vital data warehouse for consulting purposes, especially for developing countries for improving their government competitiveness. Our research has been kindly supported by the Social Science Korea Foundation based in Seoul, Republic of Korea. Last of all, I would like to extend my thanks to our co-researchers, research assistants and students in the Center for Government Competitiveness in the Graduate School of Public Administration, Seoul National University, for making this publication possible, as well as other universities and research institutes around the world for their generous help.

Competitiveness

Overview on OECD Countries

Introduction

The period between the summer of 2016 and summer 2017 can be categorized as a year of political turbulence among OECD countries. The resilience and legitimacy of the postwar liberal order began to be doubted by many people. A massive flow of refugees, haunted and harassed by raging civil wars and religious crusades, crossed national borders to enter European countries. Worried by immigrants, some people in developed countries are beginning to show anti-immigrant sentiment. Turkey, a once promising democratic country, is resembling its neighbor Russia in political make-up. While it is not clear that these trends will last for a long period of time, they are certainly putting a substantial political and economic burden on many OECD countries. If anything, the issues discussed below won't disappear anytime soon.

Collapse of Postwar Liberalism

The world today is rapidly changing. Brexit, the election of Donald Trump as the President of the United States, and rise of illiberal democracy are standing questions to the assumption that liberalism has been triumphant since the allied troops defeated Germany and Japan. Turkey, which stepped up efforts to protect civil liberties in the

2000s, is turning into an authoritarian regime after the failed coup against the Erdogan regime. President Donald Trump openly disdains liberals and immigrants. The UK's decades-long cooperation with the European Union is about to end. In many OECD countries, right-wing parties have made considerable gains in seats.

Indeed, proponents of liberalism have had it far too easy. The collapse of the Soviet Union seemed to vanquish any doubts about the global liberal order. But, deep inside, many witnessed "wealth as a cover for privilege and expertise as disguised self-interest" (The Economist, Dec. 24th, 2016).

Trump, the unlikely winner of the 2016 American presidential election, mocks the democratic process (Fallows, 2017). During the campaign, he frequently compared immigrants as rapists and criminals. He regarded mainstream news media - except for Fox - as fake news. Once he took office, his disdain for democratic institutions grew even further. He employed executive orders to bypass congressional barriers. In fact, as soon as he was inaugurated, he promulgated a series of executive orders that barred people from certain Muslim countries from visiting the United States. He has also made a

series of remarks that have rendered the Department of Justice a political apparatus rather than the foremost authority of upholding the rule of law (Baker et al., 2017). His initial reluctance to rebuke white supremacists in Charlottesville, Virginia emboldened white supremacists as well as confirmed his illiberal political leadership (Thrush and Haberman, 2017).

In Germany, Chancellor Angela Merkel is increasingly on a dicey footing. The popularity of her party, the Christian Democratic Union, lost 54 seats in the 2017 parliamentary election. Anti-immigration sentiment is growing nation-wide (Der Spiegel Staff, 2018). In fact, conservative parties in countries such as France, Germany, the Netherlands, Finland, Sweden, and Italy have gained a significant number of parliamentary seats or even formed governing coalitions.

Demographic factors partly explain the driving forces behind anti-immigration. Developed countries such as the United States, Japan, and western European countries have experienced a decline in the birth rate for decades. A rising number of immigrants have flowed into these countries for a better life and this has coincided with the rise of conservative parties. If the 2016 American presidential election confirmed it, a 2015 study of immigration and far-right sentiment in Austria showed that this was not confined to the U.S. only. Many pundits argued that the main reason behind the U.K.'s decision to leave the European Union was growing hostility to immigrants (Halla et

al., 2015; Thompson, 2017).

The anti-immigration feeling is also connected to funding welfare in developed countries. Once generous welfare states such as Finland are shrinking their welfare services. The previously accepted equation of redistribution from the rich to the poor was questioned once the poor were newly arrived outsiders. This turned the white majority resentful toward the way their taxes are spent for welfare beneficiaries (Thompson, 2017).

All of these issues generate soul-searching questions for developed countries: can diversity and egalitarianism go hand in hand in a pluralist, liberal social order? And is there any hope left for a resurgent liberal order?

Refugee Migration and Anti-Immigration Climate in Developed Countries

Closely associated with a decline in liberal democracy is the refugee crisis. In 2015, an unprecedented number of refugees fled to Europe. Whether they resulted from the rise of the so-called Islamic State, the Syrian civil war, or political instability in Afghanistan and the Middle East, the arrival in Europe of more than two million is a crisis of monumental proportion (Timsit, 2017).

As numbers of refugees from the Middle East, North Africa, and Latin America are swelling, rich countries are increasingly turning their back against them. For instance, Denmark passed a strict immigration law in early 2016. The law allows Danish authorities

to seize assets beyond \$1,450 from refugees except for those with *sentimental value* so that it can pay for their stay in the country. Caught between popular immigration destinations Germany and Sweden, Denmark saw the number of asylum-seekers swelling exponentially. In 2015, over 21,000 refugees came to the country; a year before, the number was 14,815; in 2013, there were 7,557 asylum-seekers. The law was the culmination of a series of harsh measures to dissuade refugees from coming to Denmark: cutting welfare benefits to refugees and immigrants by 45%; relocating refugees from urban locations to camps outside cities; or the mandating, in one Dutch city, of placing pork on menus at schools and daycare locations (as Muslims don't eat pork). These moves are also popular among the public. According to a survey, 37% of voters opposed providing residential help to refugees and 70% of voters deemed the refugee crisis an important political agenda (Delman, 2016). The Danish measures will surely encourage other popular refugee destination countries such as Germany, Switzerland, and Sweden to take a hard look at their refugee programs.

Turkey Turning Towards Authoritarianism

Turkey, an OECD country, plays a significant geopolitical role. It is a frontier state and gateway to Russia and Syria. It is a world caught between democracy and authoritarianism. The country also has to navigate a difficult path between the ever-present violence in its neighboring country, Syria, and authoritarian nationalism

manifested in Russia (The Economist, April 15th, 2017). And the country itself, a once burgeoning democratic one, is turning into an authoritarian regime.

It did not used to be this way. After its current leader, Recep Tayyip Erdogan, took office in 2003, he and his Justice and Development Party (AKP) implemented programs that benefited Turks. Helped by the International Monetary Fund, Erdogan reined in inflation, fostered civil liberties and started peace talks with the Kurds. He gave a voice to working-class religious conservatives who were excluded from mainstream politics for years (The Economist, Apr. 15, 2017).

But a series of problems have nudged the country towards authoritarianism. The onset of the Syrian civil war resuscitated jihadists and Kurdish militants in their political battles against the state. Within this context, the failed military coup allegedly led by the American-based Fethullah Gulen alarmed the Erdogan regime. The slowing economy due in part to corruption and a decline in tourism cast gloom over the country's future. Influenced by these, Erdogan has laid off over 100,000 and arrested over 50,000. Anyone could be deemed subversive: people associated Gulenist schools or banks, journalists and politicians with sympathy for Kurds, and even children mocking the president on social media (Cook, 2016).

Growing executive power further expanded after the referendum in April 2017. Supporters of President Erdogan hailed it as a victory for democracy. But it seemed like a

victory for a different kind of democracy (Friedman, 2017).

Following a referendum, the Turkish constitution was amended to introduce a strong executive and weaker parliament. The referendum also counted approximately 1.5 million non-stamped votes, raising suspicions of fraud. Turkey seems to have slid into an “elected dictatorship” (The Economist, Apr. 15, 2017; Friedman, 2017; Cook, 2016).

Brexit

Just days after Britons voted for Brexit, there were regrets and laments all over the country. The media blamed David Cameron for putting a monumental issue like Brexit on a vote as the majority of people could not comprehend the complicated economic and social dynamics of being part of the European Union (Friedman, 2016). Cameron hoped that the vote would please the so-called “euroskeptics” in his party. But he didn’t take the vote seriously, believing that the final outcome would not be “Leave.”

Brexit was also fueled by fear-mongering and false numbers about British monetary contributions to the European Union, dividing the country into elites who wanted to remain and working class who felt their livelihoods were threatened by outsiders (Kinstler, 2016).

Analyzing the votes cast for the Brexit can say a lot about who voted for “Leave.” It turns out that there is strong correlation between the educational levels of the voters and the actual votes cast. Voters in locations

such as London where a predominant majority of residents had a college degree were far more likely to vote for “Remain.” Other factors including the median age of a locality did not seem to be as significant as the educational level. Marital status shows a modest correlation with “Leave.” The overall picture of the voting reveals that professional singles in urban areas favored EU membership while married couples outside metropolitan areas with less than a bachelor degree preferred to leave. While correlation is not equal to causation, we can conjecture the demographic elements that divided Britain in the two camps during the Brexit voting (McGill, 2016).

By requiring a simple majority vote to exit from the EU, the vote set very low standards for Britain. There was also a lament that a “one-off expression of the people’s will” was not checked by other mechanisms such as requiring a supermajority, a second vote at a later date, or a Parliamentary majority. Checks and balances were non-existent in the referendum, claimed opponents of Brexit.

Brexit also presented a cautionary tale for those who want to have more direct democracy. Margaret Thatcher once said that a referendum is “a device of dictators and demagogues.” Or it “distill[s] complex issues into a simplistic choice, stoking a harsh type of populism” (Eavis, 2016).

Whatever merits or defects referendums may have for democracy, Brexit left a big scar and, particularly, uncertainty over the global

economy. In a few days, Britain's currency, the pound, plummeted to its lowest levels since 1985 along with the steep fall of FTSE, a London stock exchange index. A more daunting problem is that nobody is certain about what will happen to the British or even the global economy. The fact that Britain quickly lost its leader (Cameron's resignation) sent a bad signal to markets around the world (White, 2016). It is not clear how expensive the *divorce* will be to Britain, although some estimate that the exit will cost as much as 100 billion euros (Serhan, 2017). The cost is certainly subject to a myriad of negotiations between Britain and the European Union about the exit, the trade agreement after that, and so on. With the actual exit just several months away as of this writing, Theresa May faces an uphill battle to take the country out of the European Union (Brotton, 2017).

over.

What's Next?

The world today is much less stable than it seemed a few decades ago. The collapse of the Soviet Union seemed to signal the unbridled triumph of liberal democracy and a market-based economy. Fukuyama considered it the "End of History" and some celebrated with euphoria. But the bliss was short-lived. Ethnic cleansings, religious fundamentalism, terrorism, and civil wars have sapped liberal spirits. Right-wing politics and populism, race-mongering, anti-immigrant sentiment, isolationism, and authoritarianism have reared their ugly head. Certainty seems long-gone. Uncertainty and doubts about the future of the world are creeping into the minds of people the world-

Overview of Non-OECD Countries

This section provides an overview of relevant topics in terms of political, economic, and social trends across non-OECD countries, categorized by the following topics: [1] the refugee crisis [2] the changing relationship between the U.S. and China, and [3] the decline of democracy. Above all, refugee crisis is also problematic to the countries of origin of migrants as well as developed countries who have hosted refugees. The massive outflows of refugees from developing countries indicate that ongoing serious social problems - political conflicts, civil war, famine, etc. - will continue or even become worse across the countries. Next, the 40-year relationship between U.S. and China is changing unlike ever before. Many non-OECD countries, especially in Africa, have close connections with and received aid from both at the same time. Thus, how to respond to the dynamic of relationship between the U.S. and China will be one of the most important topics in their international relations. Finally, we can easily see the decline of democracy regardless of whether we are looking at developing or developed countries. The title of the *Time* article "The 'Strongmen Era' Is Here. Here's What It Means for You" shows this current political trend across the world very well (Bremmer, 2018). Any issues

mentioned below won't appear to be easy for each Non-OECD country to prepare its own effective solutions about them.

Refugee Crisis Across Different Continents

Political, economic, and social pressures arising from the massive inflow of migrant population have become a significant political burden upon the countries which accepted refugees. To make matters worse, very few Western countries have been proactive toward accepting refugees.

The ongoing battles of the Syrian civil war have amplified political turbulence and instability in the region. Since the Syrian civil war officially began on March 15, 2011, Syrian people have suffered from conflicts that have killed thousands of innocent civilians and torn the nation apart. The lack of freedom and economic recession in Syria caused people's resentment toward Assad's authoritarian rule. His forces suppress protesters by killing and imprisoning hundreds of them in 2011, while a pro-democracy uprising, called as the Arab Spring, were taking place across the Middle East. According to United Nations estimates, 400,000 Syrians have been killed. 5.5 million Syrians have fled abroad and nearly 4.5

million of them went to just five countries: Turkey, Lebanon, Jordan, Iraq and Egypt. 8.6 million of Syria's estimated 10 million children are in a dire need of assistance and nearly 6 million children are living as refugees or displaced persons. About half of Syria's educational and medical facilities and a third of its housing have been destroyed (Hjelmgaard, 2018).

Registered refugees from Afghanistan are almost 2.5 million, the second largest refugee population in the world. The all-pervading violence and deteriorating security situation across the country continue to drive people from their homes. Millions of Iraqis have also abandoned their homes because conflict and violence across their country (UNHCR, 2018).

Europe has focused primarily on the increasing war refugees from Syria, Afghanistan and Iraq. However, it is often forgotten that increasing numbers of people from North Africa are trying to head to Europe as well. Because of military conflicts, civil wars, and a devastating drought in the North African region, hundreds of thousands of Africans are fleeing across the Mediterranean Sea to Europe (Mayr, 2016).

Millions of refugees are leaving the “Northern Triangle” region of Central America. The Northern Triangle states are made up of El Salvador, Honduras, and Guatemala. Currently, the “Northern Triangle” countries are suffering from severe gang violence, insecurity, the drug trade, corruption, and other factors. To seek better

life and their safety, refugees have migrated outwardly from their countries. The United States policies have granted temporary refugee status for migrants fleeing from this region. However, those policies are coming to an end with President Trump's rhetoric and attack on criminal groups from the region. The future conditions for refugees from the “Northern Triangle” region are unstable and unknown. (King, 2018). Plus, South Sudan (2.4 million refugees), Rohingya (1.2 million refugees), and Somalia (986,400 refugees) cases can be regarded as additional refugee crises across the world.

Currently, an anti-immigration climate prevails in developed countries because the mass influx of refugees from developing countries already went beyond their bearable limit. The majority in western countries became resentful toward the way their taxes are spent for massive welfare beneficiaries newly coming from outside.

Responding to the current refugee crisis across continents, receiving and integrating refugees well is a temporary solution only for host countries, not a fundamental solution for both developing countries (of origin of refugees) and developed countries (of destination of migrants). It is because a short list of countries has enough power to provide a new home for refugees and there is a clear limit on the capacity of each hosting country's housing of the refugees.

The ultimate solution is to prevent refugee crises in advance and create an environment where most refugees are willing to return to

their origin with positive prospects for the region. These refugee crises coupled with social, especially political and economic, instability is a product of insecurity in the countries of origins of mass migrants. Therefore, to solve massive refugee crisis, it is important to incubate government competitiveness of countries generating refugees for stabilizing political turbulence and improving poor economy of them.

Drastic Environmental Change Caused by U.S.-China Relationship

For more than 40 years since the historic Nixon-Mao meetings in 1972, the basic assumption of U.S.-China relationship has been that a wealthier China is better than a poor China for all concerned, even though the center of the world economy could head toward China. Because of this reason, U.S. policy on China has been surprisingly stable. It is true that there have been many and clear disagreements where the two countries' political and social values or economic interests clashed like the Tiananmen Square crackdown of 1989, U.S. bombing of the Chinese Embassy in Belgrade in 1999, etc. However, the two countries have maintained their imperfect partnership because they have believed that Cold War-style hostility would be far more damaging to both. In the meantime, as expected, China became a wealthy nation and constitutes an axis of the world economy as the member of the informal group of two (G2) along with the U.S. (Fallows, 2016).

The U.S. bet that China would move towards democracy with its fast growing market

economy. This myth turned out to be false (Economist, 2018). More specifically, China's internet and broadcast media have always been censored and pro-government. Recently, the Chinese state has tightened its control over them more than ever before. Also, the Chinese government has suppressed further on the growth of civil society in the past five years. Beyond its territory, China puts pressure on foreign companies and organizations to follow its censorship standards. Chinese state does not hesitate to use military and economic force to achieve its political or ideological ends these days. In sum, China is likely to regress back to its communist roots, not democracy (Fallows, 2016).

Therefore, re-establishing a relationship with China is inescapable for U.S. as well as other Western countries. China is becoming more and more out of expected orbit. Following this line of thought, we can understand the current United States-China trade war as a series of U.S. efforts to reshape the relationship with China. Most non-OECD countries, especially African developing countries, are having an alliance with and receiving aid from both the U.S. and China. To respond to the international turmoil triggered by severe trade conflict between G2, most developing countries should focus on reinforcing their government competitiveness to minimize its negative impact on themselves.

The Decline of Democracy

U.S. President Trump is often regarded as a symbol of strong man style of leadership.

However, this trend is not confined to the United State. Across the world, muscular and assertive leadership is back in fashion: Xi Jinping in China; Rodrigo Duterte in the Philippines; Mohammed bin Salman in Saudi Arabia; Recep Tayyip Erdogan in Turkey; Abdel Fattah el-Sisi in Egypt; Viktor Orban in Hungary; and Vladimir Putin in Russia are all examples of this style. As Bremmer (2018) wrote, “We’re now in the strongman era.”

To the question whether this macho style leadership is good or bad, there is no right answer.

Depending on the political and economic situation of each country, strong man politics might be valid or not. The strong man type of leadership could be beneficial for a developing country to keep political stability and root out corruption in a way. However, no one can deny a probability that the strongman type of leadership could turn into a dictatorship.

Even though Trump has expressed sincere admiration for the likes of Putin, Xi, Duterte, and the likes of others, it is impossible that the United State government is run by a dictatorial regime because the President of the United States must follow the rule of law under the Constitution. Most developed countries also have a well-developed political system which could prevent strong man style leadership from becoming a dictatorship. However, many non-OECD countries do not have these types of political institutions and systems. Therefore, they urgently need structural political reform to decrease the

possibility of dictatorship in their territories.

For a Better Future

In this overview, we briefly reviewed the three major trends around non-OECD countries: the refugee crisis across different continents, the drastic change caused by U.S.-China trade conflict, and the decline of democracy. Also, we discussed what developing countries need and should do to respond to these international trends appropriately in terms of government competitiveness. However, it is difficult to improve government competitiveness drastically in a short period. Thus, most countries, especially non-OECD countries, don’t have to have joy and sorrow in a quick alternation about their current government competitiveness. Rather, it is more important than anything else to set up a long-term plan to improve their government competitiveness and implement it for a better future.

What is Government Competitiveness?

“The power of government to, in light of various constraints, take resources from in and outside of the country and improve social, economic and cultural conditions of the nation in order to sustainably enhance citizens’ quality of life.”

Government Competitiveness (GC)

Level of Analysis: Nation

Focus: Government

Future Oriented

Reflecting Changes Made by Government Efforts

Comparing Nations

What makes some governments more competitive than others? At a minimum, addressing this question requires a basic understanding of what government competitiveness means. The term

government competitiveness is often used interchangeably with a host of similar concepts, many of which have been employed by research institutes such as IMD and World Economic Forum (WEF). Studies of competitiveness focus primarily on the national level, but GC and national competitiveness are not the same. GC is also frequently confounded with other concepts, including government capacity, good governance, and quality of government, national power, government effectiveness, organizational competitive advantage, and performance management.

The academic literature reveals several challenges in measuring GC. For example, some related concepts and their measurement reflect an ideological bias, such as the virtues of a free-market economy. As a result, some indices of national competitiveness – a concept similar to GC – focus primarily on economic and market indicators such as business-friendly conditions and economic growth. They are therefore less likely to include indicators of effective government, such as human development outcomes like education, healthcare, and social capital.

In light of these weaknesses, the Center’s approach to understanding GC necessitates a

multi-dimensional approach to measuring government support of citizens' well-being. GC is, in turn, defined as "the power of government to, in light of various constraints, take resources from in and outside of the country and improve social, economic and cultural conditions of the nation in order to sustainably enhance citizens' quality of life." The concepts of "constraints" and "quality of life" can be interpreted flexibly, depending on a nation's unique setting.

Emphasizing Government's Role

Existing national competitiveness indices, while helpful, suffer from certain theoretical and methodological shortcomings. With a disproportionate focus on business-related factors, indices such as those introduced by the International Institute for Management Development and World Economic Forum emphasize industrial productivity over social outcomes. Government's role in and contribution to general welfare has been unduly overlooked.

As such, a burgeoning line of research has begun to broaden the concept of national competitiveness, by exploring additional dimensions. This developing line of research has also, in recent years, spurred interest in governments' relationship to different aspects of national competitiveness. In turn, several institutions have begun to develop indicators emphasizing the role of government in driving development and national competitiveness.

Prominent examples include the World Bank's Worldwide Governance Indicators (WGI) and the Quality of Government Institute's (QGI) (the University of Gothenburg) Quality of Government indicators (QoG). While these two indices represent important steps toward improving scholarly understanding about how

government supports competitiveness, they also suffer from deficiencies that represent opportunities to improve on competitiveness studies.

The concept of GC adopts Easton's Systems Theory as a guiding theoretical framework. Systems theory assumes that a system, in a dynamic relationship with its environment, absorbs various inputs, transforms them in certain ways, generates outputs, and achieves certain outcomes. This view suggests that organizations can accomplish their objectives with varying internal activities (conversion processes).

Based on systems theory, the GC categorizes government roles into four sequential levels: input, throughput, output, and outcome. Most national competitiveness indices measure outputs as the main contributors to a country's competitiveness, but this method under-evaluates the competitive potential of countries with high information processing capacity or public management capability.

In contrast, the GC Index first analyzes competitiveness through each of the four levels: input, throughput (public management capacity), output, and outcome. The index then aggregates results from each level to produce an overall competitiveness score. This approach generates a variety of

policy implications at each systemic level.
The following are some sub-categories for each stage.

Input: resources, infrastructure,
government expenditure, environment

Throughput: human capacity,
management capacity, policy, system,
process

Output: production, growth rate,
improvement level, immediate goal
achievement

Outcome: quality of life, satisfaction,
social capital, ultimate goal achievement

Frequently Asked Questions for GC

1. How is GC different from other indices?

One of the major issues that most previous indices share is that they have focused heavily on the market & business side of government quality. Due to this reason, those indices in ways lack serious effort to deal with the data and including the role of government in analysis.

To address this issue, GC suggests positive and normative aspects of government roles based in GC systems theory as a guiding theoretical framework. GC systems theory assumes that one system, in a dynamic relationship of government with its environment, absorbs various inputs and transforms them in certain ways that generate outputs and can achieve certain outcomes; the system incorporates the stage of development of OECD and Non-OECD countries.

2. How much does my county's overall ranking matter?

Your county's ranking is based on a *relative* score, which does not signify an absolute level of the performance. Also, a small difference in the actual scores may result in a large difference in ranking.

In addition, oftentimes numerous policy areas have conflicting relationships. For example, when a developing country follows

the GHG regulation, this may hinder their economic productivity. Therefore, we suggest you to focus on the result of each policy area rather than overall GC ranking.

3. How are subgroup categories formed? Why do subgroup rankings vary under the same policy area?

Subgroups in GC policy areas is designed to suggest more detailed policy suggestions. Subgroups are classified through factor analysis of relevant indicators. Since one GC policy area is composed of a wide variety of indicators, subgroups reflect various aspects of the policy area, and may present varied results.

4. Why do we care about *Throughput* results?

"Throughput" is a unique lens to look at the potential of a government. GC has functions of (1) summarizing the current status of a government as well as (2) predicting the potential growth of it with the *Throughput* system. In the context of developing countries, the critical step is throughput, which determines the level of output, especially with limited input.

5. How is GC Data collected?

We collected raw data published by international organizations along with NGOs and government reports. Among the

collected data, those relevant to the roles of government are sorted into each GC policy areas for OECD and Non-OECD countries. These sorted data went through an in-depth assessment over their validity, availability, and substantiality of the data.

6. Does Center for GC produce their own data?

Yes, we produce our own data sets particularly on developing countries. In 2017, the GC Global Survey was conducted with government officials in the central government of 51 Non-OECD countries. The survey captured the government human, financial, and institutional capacity as well as official's perception and behavior. The Center for Government Competitiveness is targeting to expand the number of participating countries.

GC Methodology

We collect raw data published by approximately thirty international organizations along with NGOs and government reports. Among the collected data, those pertinent to the roles of government are sorted into GC policy areas for OECD and non-OECD countries. These sorted data, then, undergo an in-depth assessment over their validity, availability, and sustainability. Especially, data that are not updated at least biennially are excluded while new indicators that meet the selection criteria are added.

For a given indicator k , the value of a country l was rescaled from 0 to 1 in the following way:

$$score_{lk} = \frac{value_{lk} - \min value_k}{\max value_k - \min value_k}$$

Note that indices for OECD countries are different from those for developing countries and, as such, the scores for two groups are estimated separately.

Now, indicators under a policy area are categorized into one of the four stages: input, throughput, output and outcome. We calculate the score for each stage by

averaging the scores of indicators that fall under it. In other words, the score for the country l 's policy area i and stage j is:

$$stage\ score_{lij} = \frac{1}{n} \sum_{k_1}^{k_n} score_{lk}$$

where k_1, \dots, k_n represents the indicators that fall under policy area i and stage j . Then, following the same process, the policy score for a country l 's policy area i is calculated as an average of the scores for the four stages. Finally, a country l 's GC score is the average of all policy scores.

GC Policy Areas

Agriculture and Food

One of the most basic essentials for life is food. A competitive government needs to effectively intervene in strategic planning and priority setting for agricultural innovation and development.

There are two different sets of the sub-categories for OECD and non-OECD countries. For OECD countries, the policy area consists of three sub-categories: institution and finance, resources, and productivity. Institution and finance measures the government's systemic effort in the agricultural sector; resources indicates a given country's resources, and productivity refers to agricultural production capacity.

For non-OECD countries, the policy area consists of two sub-categories: agricultural production and food quality and safety. Agricultural production mirrors the government's efficiency in agriculture while food quality and safety measures the qualitative nature of agriculture and food.

Culture and Tourism

Culture can drive economic growth through its ingenuity. Governments pursue cultural diversity by accommodating international meetings and tourism industries that engage new audiences to their cultures. These

attempts help cultivate more tolerance towards international culture and this, in turn, leads to flourishing culture of a given country.

This policy area is considered only for OECD countries. It is made up of the two sub-categories: cultural goods and tourism. The former measures cultural investments and experiences while the latter considers government expenditure and the number of in-bound tourists.

Economy

Economy growth and prosperity is vital to a nation's survival. It has become apparent in recent decades that the government's assistance is crucial for maintaining and stimulating the economy.

The policy area consists of two sub-categories: economic fundamentals and economic institutions and policy. Economic fundamentals trace each country's economic situation; economic institutions and policy reflects the government's efforts to aid the economy.

Education

Quality human resources are vital for a nation's economy. As such, education serves

as a focal point for government competitiveness.

There are two different sets of the sub-categories for OECD and non-OECD countries. For OECD countries, the policy area consists of three sub-categories: education endowment, education performance, and government involvement. Education endowment measures institutional support; educational performance identifies the actual results of education such as individual wages; government involvement considers governmental policies.

For non-OECD countries, the policy area consists of two sub-categories: educational performance and government involvement.

Environment

Economy can grow at the expense of the environment. To prevent that from happening, governments are responsible for establishing and maintaining policies to ensure sustainable development and protect citizens' safety and health.

The policy area is made of several sub-categories: environmental behavior, environmental resource protection, and renewable energy. Environmental behavior measures individuals' consumption behavior relating to biologically productive land and water areas. Environmental resource protection examines physical conditions of the environment such as air quality, the status of natural resources, and available species. Renewable energy refers to the capacity to produce electricity.

Governance

Government competitiveness relies on a stable political system and a vibrant, democratic civil society. Even for well-devised policies, their implementation can fail unless buttressed by a stable, mature political system and civil society.

There are two different sets of governance measures. For OECD countries, governance consists of two sub-categories: political competency and administrative competency. Political competency measures citizens' political participation as well as the degree to which a given government's political system is well-designed. Administrative competency measures the degree to which civil service is transparent and efficient.

For non-OECD countries, governance consists of three sub-categories: rule of law, civil society, and freedom. Rule of law measures the degree to which authority and influence of law is felt in society. Civil society examines democratic culture and citizens' political participation. Freedom measures freedom of belief, expressions, and associations.

Health and Welfare

Health and welfare policy has evolved from the idea that human dignity should be protected through decent medical care and material support for the basic rights of the people. Thus, competitive governments can develop equitable health care and welfare systems that provide social safety nets, adopt a lifelong health approach, and support retirement stability. The ultimate goal of the

health and welfare area pursued by the government includes standards related to mortality, disease, disability, happiness, and a decent life.

There are two different sets of sub-categories for OECD and non-OECD countries. For OECD countries, the policy area is made up of two sub-categories: health and welfare. Health measures people's health such as prevention and treatment of diseases. Welfare, on the other hand, reflects government's efforts to protect people's welfare.

For non-OECD countries, the policy area consists of four sub-categories: disease management, life and death, safety and public health, and welfare. Disease management refers to the control, prevention, and treatment of epidemic diseases; 'life and death' measures the life expectancy and mortality; 'safety and public health' reflects national medical resources; and 'welfare' considers national social protection efforts.

Information & Communications Technology (ICT)

ICT brings well-known benefits to a given country and its citizens. But building ICT infrastructure can be extremely high, requiring governments to step in.

The policy area consists of three sub-categories: scale, promotion, and utilization. Scale measures whether a country has well-developed infrastructure for ICT. Promotion refers to the degree to which a

country prioritizes ICT policies. Utilization focuses on the use of ICT technologies and the impact of ICT development on diverse areas.

Infrastructure

Infrastructure refers to major facilities in a given country. Given that a country's infrastructure development requires a long-term perspective, government policies need to consider both imminent needs and future improvement plans.

This policy area is considered only for non-OECD countries. The policy area consists of one sub-category, infrastructure. It measures diverse infrastructure resources as well as government's capacity to manage them.

Research and Development

Governments play a crucial role in financing R&D programs. Major focus is on physical and human capital investments that are expected to produce concrete outputs from both academic and industrial environments. Governments also perform R&D activities on their own, in order to accelerate and support important, yet overlooked basic research.

R&D policy area is considered only for OECD countries. It consists of three subgroups: academic, entrepreneurial, and governmental. The "academic" subgroup represents tangible inputs, outputs, and outcomes for research and development in the academic sector. The "entrepreneurial" subgroup indicates investments and accomplishments of the private sector's

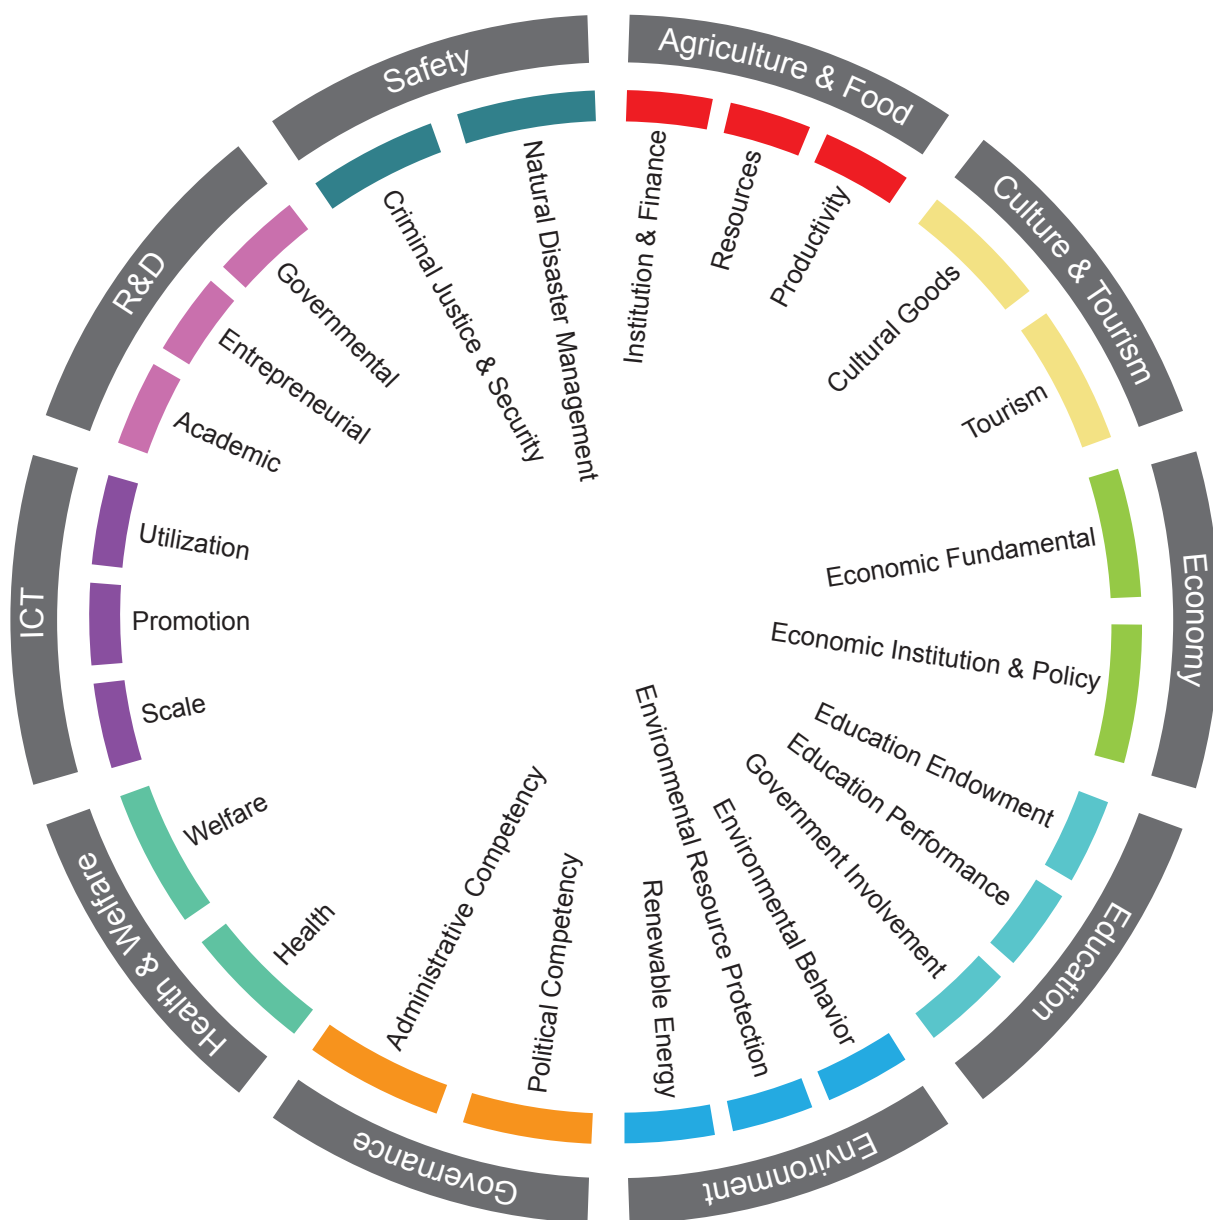

research and development activities, while the “governmental” subgroup measures the amount of government-financed expenditure on R&D and the performance of government-run research and development programs.

Safety

Safety is about protecting citizens from perils that might harm people’s physical health and human property. To be safe is one of the basic needs of human beings. To keep people safe from hazards is a fundamental government function.

This policy area consists of two sub-groups: criminal justice and security and natural disaster management. Criminal justice and security concerns criminal justice and terrorism. It measures whether a country effectively controls crimes and protects its people from acts of terror. Natural disaster management deals with a government’s capacity to deal with natural disasters (including earthquakes, floods, tsunamis, windstorms, droughts and more) and protect people’s lives and properties from them.

Policy Areas: OECD Countries

Policy Areas: Non-OECD Countries

1. Non-OECD Countries: Africa

Ethiopia

Country Profile

Ethiopia is the oldest independent country in Africa and had been a symbol of African independence during the colonial period. It has never been colonized except a five-year occupation by fascist-ruled Italy between 1936 to 1941. Ethiopia was a founding member of the United Nations and many international organizations. A monarchy of Ethiopia was ended by military coup and the Marxist Derg regime seized power in 1974. The official name of Derg is the “Provisional Military Government of Socialist Ethiopia.” Between 1977 and 1979, thousands of government opponents were murdered, tortured, abducted, or imprisoned without trial in “Red Terror” led by Derg leader Colonel Mengistu Haile Mariam (BBC News, 2018a).

Ethiopia had suffered from the worst famine with wide-scale drought, bloody coups, uprisings, and massive refugee problem in 1980s. Finally, socialist regime in Ethiopia was toppled in 1991 by the Ethiopian People's Revolutionary Democratic Front. In 1994, new constitution was adopted, and the first democratic election was held in 1995 (BBC News, 2018a).

About the historical relationship between Ethiopia and Eritrea, first, Ethiopia annexed Eritrea in 1962. However, Eritrea became independent following a referendum in 1993. In 1999, armed clashes alongside Ethiopian-Eritrean border line turned into a full-scale war. Even though this border war ended with a peace treaty in 2000, there have been long-held disputes along the border line between them. It wasn't until this year that Ethiopia and Eritrea declare that the state of war that existed between them was over. (Al-Jazeera, 2018).

Ethiopia's GDP growth has been impressive since 2005. Its annual average is 10%. This economic growth is due to better supportive policies led by the government with increased productivity. Also, more Foreign Direct Investment (FDI) and the active roles of private equity players and local entrepreneurs can be regarded as additional reasons for Ethiopia's rapid economic growth (Haddis Tadessee, 2013).

The population of Ethiopia is 102.5 million people and it is the second largest country in terms of population. Even though more than 70% of its population is still working in the agricultural sector, the principal source of Ethiopia is a service sector. Its main

languages are Amharic (official), Oromo, Tigrinya, and Somali. Ethiopia has a unique Christianity heritage as the home of the Ethiopian Orthodox Church which is one of the oldest Christian churches. Islam is also another major religion Ethiopia. The life expectancy is 63 years for men, and 67 years for women (BBC News, 2018b).

The Period between 2016 and 2017: Anti-Government Protests and Slower Economic Growth

Anti-government Protests erupted in Ethiopia on August 5th, 2016. Protesters demanded social and political reforms. The government responded by attacking and arresting protesters with restricting access to the Internet (Gettleman, 2016; Warner, 2016). The Human Rights Watch estimated that at least 500 people had been killed as of October 2016. This bloody suppression was marked as the most violent crackdown against protesters since the protests in the Ethiopia's Oromia Region in 2015.

In 2015, the Oromo protesters' first demand was to cancel the master plan to expand the boundaries of Addis Ababa, the capital of Ethiopia. At that time, they concerned that their lands were confiscated by city and they should leave their lands without any compensation. However, their demands quickly became bigger by raising the more political and socioeconomic rights for the Oromo. The Amhara began demonstrations because their demand to retake control of parts of their lands was unfulfilled. However, the Amhara people also included other issues

like the disproportionate political and economic power of the Tigrayan People's Liberation Front (TPLF) in the ruling coalition. The main reason of anti-government protest is that Ethiopia government is ruled by minority elites from the Tigrayan, who make up only 6.1% of total population. If ruling minority elites allow autonomy to Oromo and Amhara for their regions, these two majority ethnic groups would take a leading role nationally because Oromo is Ethiopia's largest (34.4%) and the Amhara is second-largest (27%) ethnic group in Ethiopia. That is one of main reasons of mass anti-government protests and the fear of the current elites in Ethiopia (Kestler-D'Amours, 2018).

Ethiopia has been one of the fastest growing states among the 188 IMF member countries more than a decade. The annual GDP growth had been between 8% and 11% during this period, which had been driven by governmental investment for improving infrastructure and substantial development in the agriculture and service areas (Central Intelligence Agency, 2018).

However, economic growth fell to 8% from a previous annual average of 10% in 2016. The government blamed drought for the cause of the economic downfall, but most media and other observers said that political and social unrest had also an effect (BBC News, 2018b)

Minimizing Ethnic Conflict for Political Stability, a Peaceful Relationship with

Eritrea, and a State-Led Economy for a Better Future in Ethiopia

In March 2018, Abiy Ahmed was chosen as the prime minister to lead the ruling Ethiopian People Revolutionary Democratic Front coalition with a reformist agenda. Unlike before, Mr Abiy is a member of the Oromo ethnic group. Thus, one of his important tasks would be to address Oromo people's prevailing perceptions of the political and economic marginalization. Even though the ruling coalition is trying to increase ethnic representation, the priority of it is to protect its hegemony. A historic peace agreement was made with Eritrea in July 2018, which could boost Ethiopia's economy (Economist, 2018).

Ethiopia was ranked 107th of 180 countries in the Transparency International's 2017 Corruption Perception Index (CPI, 2017). Major foreign corporations doing business primarily with the Government of Ethiopia reported that corruption in Ethiopia is "insignificant" compared to other African countries. However, domestic or foreign businesses still quotidianly encounter corruption everywhere such as tax collection, customs, land administration, etc. (U.S. Department of State, 2018).

Ethiopia has five-year plans for its government-led industrial development. The second of these Growth and Transformation Plans (GTP II) covers the period between 2016 and 2020. The main object of GTP II is to achieve middle-income status by 2025. For economic development, GTP II

identified Ethiopia's priority sectors: renewable energy, tourism, textile and apparel, leather products, etc. Low labor cost, the world's cheapest energy price, growing domestic markets, and a good location for business with other African countries can be regarded as strengths of Ethiopia for attracting foreign direct investment (FDI) (U.S. Department of State, 2017). The overall ranking of Ethiopia is marked as 78th among 88 non-OECD countries. This is the almost same as last year's ranking (#77). More specifically, the ranking for its output (#65) is relatively higher than its input (#85) throughput (#76) and outcome (#76). Among the sub-fields, its ranking in environment (#27) is relatively higher than any other fields in Ethiopia. Even though the ranking of safety (#43) is still in the lower and middle level, its rankings has increased by twenty-six compared to last year because of the effort of ruling coalition to increase ethnic representation and a historic peace agreement with Eritrea. In addition, the ranking of ICT (#59) has increased by eighteen steps (ICT) compared to 2017 based on state-lead reforms. Infrastructure (#86), agriculture and food (#78), education (#86) and governance (#85) are relatively lower than any other countries in Non-OECD.

Rwanda

Country Profile

Rwanda, a small landlocked country in central Africa. Before its independence in 1962, Rwanda was under the German and Belgian control. In 1961, Rwanda proclaimed a republic and forced its monarch, Kigeli, into exile. Rwanda is trying to recover from the severe ethnic conflicts that culminated in genocide in the mid-1990s. In the genocide, dominant Hutu militia and soldiers killed an estimated 800,000 ethnic Tutsis and moderate Hutus in 100 days between April and June 1994. The reason of genocide is its age-old ethnic tension associated with the traditionally unequal relationship between Tutsi and Hutus (BBC News, 2018a).

Rwanda's judicial system was left in ruins after the genocide in 1994. To try the ringleaders of the genocide, the UN's ICTR (International Criminal Tribunal for Rwanda) was set up in Tanzania. However, it was impossible that ICTR handled the cases of more than 1 million ordinary people accused of involvement in the genocide because of the limitations of time and resources. Thus, 12,000 community courts, Gacaca, were set up for seeking to try genocide criminals and promote forgiveness by victims for reconciliation in communities. Rwanda's gacaca courts have often been lauded by international proponents as a successful model for post-conflict reconciliation efforts. However, opponents, especially human rights group, said that traditional grassroots courts fell well short of international legal standards

to try complicated genocide cases (Seay, 2017).

Paul Kagame, the incumbent president of Rwanda, was vice-president and defense minister in the post-genocide government in 1994. He has widely been regarded as the real power in Rwanda since then. He became the president in 2000 and has effectively run Rwanda until now. However, there have been criticisms of his political and human-rights records at home and abroad (BBC News, 2018a).

Rwanda is an agricultural country; its agriculture accounts for about 63% of Rwandan export. Coffee and tea are Rwanda's main sources of foreign exchange. Also, tourism, agro-processing, and minerals are regarded as important industrial areas in Rwanda. Rwanda has fertile land. However, its food production often does not meet demand and brings a need for food imports. Energy shortages, the ongoing political crisis in neighboring Burundi, and lack of infrastructures continue to disturb private sector growth. The population of Rwanda is approximately 12.5 million people. They are using three official languages - Kinyarwanda, French, English -, and Swahili. Christianity and indigenous are major religions in Rwanda. The life expectancy is 54 years for men, and 57 years for women (BBC News, 2018b). Rwanda has a temperate climate and its land consists mostly of mostly grassy uplands with hills. Also, its population density is one of the highest in Africa and large population are living in the central and

along the shore of Lake Kivu in the west side of Rwanda (Central Intelligence Agency, 2018).

The Period between 2016 and 2017:

Little Political Violence and Fast Economic Growth

Political environment of Rwanda is stable with relatively little violence. Also, the potential of criminal activities is low because of its strong police and military. However, occasional cross-border attacks targeting Rwandan police stations and army bases by the FDLR have been reported. FDLR is acronym for the “Democratic Forces for the Liberation of Rwanda,” which is an armed group composed of former supporters and sympathizer of the regime that committed the 1994 genocide. This armed force is operating in the east side of the Democratic Republic of the Congo (DRC), near the Rwandan border. Despite FDLR’s violence along Rwanda’s border with eastern DRC, there have been no politically motivated incidents damaging political stability and foreign investment projects in Rwanda since the late 1990s (U.S. Department of State, 2016).

To rebuild its economy, Rwanda has focused on coffee and tea production among its main exports. However, Rwanda is trying to shift its focus from agriculture and services to light manufacturing. In terms of fiscal policy, Rwandan government has expanded its budget to alleviate poverty by improving education, infrastructure, and investment. Rwanda's case has been praised as a

"remarkable development success" for reducing poverty and inequality by the World Bank. However, the uncertainty of aid flows might delay further expansion.

Improving ICT, Public Health, and Gender Equality for a Better Future

Rwanda has a plan to reach middle-income status by 2020 and this “Vision 2020” emphasizes improving the Information and Communication Technologies (ICT). The Rwandan Government has an ambition to become a regional leader in Africa in ICT. Rwandan government launched an online system to supply investors with the useful information about public land use for agricultural development in 2016. In 2018, Korea Telecom (KT) has completed the construction of 4G national wide mobile network (TechMaran, 2018).

There have been substantial improvements in public health. Like other African states, AIDS is still a critical problem for public health in Rwanda. The trend of new HIV/AIDS infection is declining by innovative approaches to treatment. Under national health care, about \$2 is required for insurance coverage for HIV/AIDS. However, it is also true that there are still lots of people who cannot afford this insurance payment in Rwanda.

In terms of gender equality, Rwandan constitution stipulates that at least 30% of all public-sector jobs should be assigned to women. Also, 63.8 % in the lower house of Rwandan legislature are female. Previously,

Rwanda has experienced a radical decline in male population due to the genocide and civil war, which increased the need of women's participation in various social fields including politics.

The economic growth of Rwanda is strong, and it consistently ranks well for the ease of doing business and transparency. Its ranking is 62nd of 187 in the World Bank's Ease of Doing Business Index and 44 of 185 in TI (Transparency International) Corruption Perception Index 2017 (CPI, 2017). In order to improve investment environment in Rwanda, many pro-investment policy reforms have been undertaken by the Government of Rwanda (GOR). To accelerate economic development of Rwanda, there are some constraints waiting for solutions: high freight transport costs caused by its landlocked geography, a small internal market, the backward financial system, etc. (U.S. Department of State, 2017). Because the economic and social development of Rwanda is highly depending on foreign aid, it is very critical to keep stable inflows of it. Low-level public infrastructure should be updated as soon as possible (Ministry of Infrastructure, 2011; AFDB, 2014). Rwanda's overall ranking is 51th among 88 Non-OECD countries. This is the almost same as last year's ranking (#53). Specifically, the rankings for its throughput (#36) and output (#34) are relatively higher than its input (#66) and output (#58). Among the sub-fields, its ranking in economy (#17) and safety (#18) are relatively higher and infrastructure (#58),

public health (#55), agriculture and food (#54), education (#66) and governance (#77) are relatively lower than other fields.

Zambia

Country Profile

Zambia, the old name “Northern Rhodesia”, is a landlocked country located in southern Africa. Britain put Northern Rhodesia under its colonial rule in 1889. Kenneth Kaunda launched the UNIP (United National Independence Party) for independence struggles in 1960. In 1964, Northern Rhodesia became independent of the United Kingdom and renamed Zambia. Kaunda became the first president and had ruled Zambia for next 27 years. Between late 1960s and early 1970s, major enterprises and private land nationalized. In 1972, Zambia became a one-party state and UNIP had been the only legal party until 1991. In 1991, multi-party democracy constitution was adopted and Frederick Chiluba’s Movement for Multi-Party Democracy (MMD) won elections (BBC News, 2018a).

There is no historical record of large-scale political violence in Zambia; unlike most of its neighbors, Zambia has avoided the war and drastic social change that has marked much of Africa's post-colonial history (BBC News, 2018b). Rather, Zambia has a praiseworthy record of democratic elections, which has resulted in two peaceful turnovers of political power from one party to another since its independence. The type of Zambia government is a presidential republic (U.S. Department of State, 2017).

Zambia has experienced fast growing economy over the last decade. Its economy

growth is highly depending on copper because Zambia is the largest copper producer except DR Congo. However, its over-reliance on copper has predisposed its economy to falling commodity prices. Its economic growth and massive Chinese investment have not contributed to improving the lives of most Zambians. Two-thirds of population is still living in poverty (BBC News, 2018b).

The population of Zambia is 16.5 million people and it also has one of the world's fastest growing populations. UN projects that its population will triple by 2050. Its official language is English, but people use other languages like Bemba, Lozi, Nyanja, and Tonga. Major religions are Christianity, indigenous beliefs, Hinduism, and Islam. The life expectancy is 59 years for men, and 64 years for women (BBC News, 2018b).

Zambia has a tropical climate and its land consists mostly of high plateaus with some hills and mountains. Even though large parts of Zambia are thinly populated, it has one of the highest levels of urbanization in Africa, particularly around the cities of Lusaka, Ndola, Kitwe, and Mufulira, known as the “Line of Rail” (Central Intelligence Agency, 2018).

The Period between 2016 and 2017: An Increase of Political Tensions and Ongoing Poverty

More recently, political tensions have been on the rise that continues at present unlike before. There were many clashes of

supporters of different political parties, resulting in injuries and arrests ahead of 2016 elections. Incumbent president Edgar Lungu for Ruling Patriotic Front (PF) was reelected but the opposition party, the United Party for National Development (UPND), contested the result of the election because the official result of 2016 election fell within 2.72% between the winner and the loser and the campaign period was marred by political violence (U.S. Department of State, 2017).

Since the 2016 election, Zambia government has attempted to clamp down on critics of President Lungu and the ruling party, Patriotic Front (PF), even though President Lungu was successfully reelected and the PF had the majority seats in parliament. According to the report of U.S. Department of State, media freedom in Zambia has been curtailed (U.S. Department of State, 2018).

The debt of Zambia estimated by the World Bank is at 60 % of GDP, but it could be much higher according to other credible reports. Economically, Zambia is faced with the challenge of diversifying its economy because the economy is highly dependent on copper exports. To address the poverty of its people, it is also important to accelerate private sector-led growth. Even though Zambia enjoyed relatively high economic growth averaging more than 7 % for over a decade, it was mainly caused by high commodity prices.

Poverty, red tape, and corruption are the

most pressing issues which minimize the impact of government efforts in the economic area of Zambia. Furthermore, rampant government spending, large-scale borrowing, and inconsistent economic policies have made its economy vulnerable to shocks caused by instability in copper prices and poor electricity generation (U.S. Department of State, 2017). Economic growth of Zambia remains subdued at 3.8 percent in 2017 even though its economy recovered slightly following an increase in the price of copper, improved electricity generation, etc. Its economic growth is forecast to be 4.1 % in 2018 and 4.5 % in 2019 based on World Bank's latest available data mainly because of weak performance in the mining, construction, and services sectors (U.S. Department of State, 2018).

Establishing Political Stability and Overcoming Institutional Shortcomings to Improve Government Competitiveness

Internal political tension and wrangling will be likely to produce an unstable political environment (Economist, 2018). Therefore, political stability should be one of prime concerns for Zambia. It is also important in terms of Zambia's government competitiveness to overcome institutional shortcomings relevant to inefficient legal and regulatory frameworks, unsustainable fiscal policy, and corruption.

Especially, the corruption has been thwarting developing countries politically, economically, and socially. Zambia was ranked 96th of 180 countries in Transparency International's

2017 Corruption Perception Index (CPI, 2017). Many business surveys indicate that corruption is a major obstacle for conducting business in Zambia. Given these reasons, Zambia government has strengthened the legal and institutional frameworks against corruption, red tape and bureaucratic procedures. About fiscal policy, Zambia government historically has not executed its budget very well. Because of lack of clarity on fiscal policies and widespread borrowing, a much-anticipated USD 1.3 billion loan deal was delayed by IMF (U.S. Department of State, 2018).

AIDS should explicitly be taken into account because of its excessive mortality in Zambia. Environmentally, deforestation is the one of serious problems and desertification is in effect in Zambia. The lack of adequate water treatment is an urgent issue for public health (Central Intelligence Agency, 2018). Zambia is one of China's oldest partners and the second largest destination of Chinese investment in Africa. However, Zambia is often cited as a bad example of what can go wrong with Chinese investment in Africa. Therefore, it can also be an important task for Zambia to re-establish a relationship with China for solving the age-old problems between them. Zambia's overall ranking is marked as 68th of 88 non-OECD countries. This is the almost same as last year's ranking (#67). Specifically, the ranking for its outcome (#77) is relatively lower than its input (#67), throughput (#53) and output (#68). Among the sub-fields, its ranking in environment (#1) is the highest one of

Zambia. Even though the ranking of health and welfare is still in the lower and middle level (# 66), its ranking has increased by eighteen steps compared to last year because of governmental efforts to develop preventive measures against AIDS and other disease and improve general health hygiene. Infrastructure (#74), agriculture and food (#86), safety (#80), and ICT (# 77) are relatively lower than the others.

1. Non-OECD Countries: Asia

Azerbaijan

Country Profile

After tumultuous political struggles, the country declared itself an independent republic in 1991. The country is a major oil producer and a strong energy leader in the region. Using money gained from oil, the country has focused on strengthening the army. Despite wealth and geopolitical influence in the region, the fledgling democracy has been overshadowed by corruption and oppression of human rights. The country's democracy has chequered progress (BBC News, 2018a).

Azerbaijan is home to 9.95 million people (2017 Revision of World Population Prospects); its major languages include Azeri and Russian; people of Azerbaijan mainly believe in Islam; Azerbaijan men are expected to live 69 years while women's life expectancy is 75 years (BBC News, 2018a).

The country is home to Baku, the world's first oil well drilled in 1848 to 1849. The country declared its independence in 1918 and became a Soviet Socialist Republic just two years later after the invasion of the Red Army. The country was finally able to break up with the Soviet Union in 1991, but, soon,

it began to experience rising ethnic tensions between Armenia and Azerbaijan which would culminate in a war by 1992. In 1994, Armenia, Azerbaijan and Nagorno-Karabakh signed a ceasefire agreement through which ethnic Armenians could control Karabakh and a surrounding Azerbaijani territory (BBC News, 2018b).

In 1994, the country reached an agreement with international oil producers itself referred to the "Contract of the Century." Heydar Aliyev also took over the country in 1993 and served until 2003. The current president of Azerbaijan is Ilham Aliyev. He also inherited the power from his father, Heydar Aliyev and has led the country since 2003. The 2003 election was considered not up to democratic standards, but resistance by the opposition met stern retributions from the police. Aliyev is serving a third five-year term and it was made possible by eliminating the two-term limit through a 2009 referendum. In 2016, voters also approved in a referendum constitutional changes that would extend presidential powers. Within the changes was the controversial provision that lowered the age qualification for presidential candidates. The opposition argued that it was intended for President Aliyev's 19-year-old son. Human rights activists have also

accused him of oppressing freedom of expressions; in fact, voices criticizing the Aliyev regime have disappeared in the mainstream media due to arrests and imprisonment of journalists. The opposition, thus, shifted its medium to social media such as Facebook (BBC News, 2018b).

The Period between 2016 and 2017: Declining Human Rights and Weakened Democracy

Blessed with some of the largest oil and gas reserves in the world and being in a unique geopolitical location neighboring the Middle East, Europe, and Russia, Azerbaijan has attracted enviable courtship of the United States and Europe. The country is also immune from the extreme Muslim fundamentalism that wreaked havoc on the Middle East (Mammadov 2016).

These may explain why American and European countries have shunned from rebuking Azerbaijan's miserable human rights records. In fact, Secretary Kerry of the Department of States heartily welcomed President Aliyev's visit to the United States; the European External Action Service's Sub-Committee on Justice, Freedom, Security and Human Rights also visited Baku, the capital city, and did not say much about abuse of human rights in Azerbaijan (Mammadov 2016). According to Transparency International's 2016 Corruption Perceptions Index, the country was ranked 123 out of 176 countries. On the other hand, the country's GDP grew exponentially from \$8.8 billion in 1991 to \$75 billion in 2015. These

surely explain why people are increasingly getting restless over the country's democratic trajectory (Mammadov 2016).

Within these contexts, the constitutional referendum held in September 2016 further eroded Azerbaijanis' confidence in the future of democracy. The referendum shifted considerable power from the parliament to the president; it lengthened the presidential term from five to seven years; it created an opportunity for the president to appoint loyalists who could serve as vice and first vice president, the latter of which can bridge intervening years between the current president and his 19-year-old son (Mammadov 2016). In addition, the changes entailed the executive power to call for an early presidential election as well as to dissolve parliament (Bagirova, 2016).

Those arguing for the expanded presidential power claimed that the lengthened term is necessary to cut red tape and ensure stability in an environment of declining oil prices (Bagirova, 2016).

The prospect of democracy is grim in Azerbaijan. There are a significant number of political prisoners in wretched conditions. There are no independent media capable of criticizing what the government does (Mammadov 2016). The popular opposition blogger Mehman Galandarov died in jail in May 2017 (BBC News, 2018b). In August 2017, the government initiated a bogus investigation of Turan News Agency regarded as the last independent agency in

Azerbaijan and closed it (Gogia, 2017).

Ethnic Clashes Continue

Beginning in early 1990s surrounding the Nagorno-Karabakh region, Azerbaijan and Armenia have had skirmishes for years. Just in December 2016, the two countries were again engaged in a conflict, resulting in at least three soldiers killed on the border. Both accused the other of first instigating the accident (Hille, 2016). The two sides were again engaged in a battle in February 2017 (Aljazeera, 2017).

Although Nagorno-Karabakh mainly consists of Armenians, the territory has been a part of Azerbaijan. The ethnic strife dates to the final days of the Soviet Union when Armenians in Nagorno-Karabakh tried to break away from Azerbaijan. This has poisoned the relationship between the two countries and continuous ethnic tensions show no signs of abatement. This relatively minor skirmish followed the severe fighting that took place just several months earlier in April 2016. Considered the worst conflict since the 1994 ceasefire agreement, the violence lasted four days and, according to a U.S. Department of State estimate, it produced over 350 military and civilian casualties. It involved the Artsakh Defense Army—a self-defense unit of the internationally unrecognized Republic of Artsakh consisting of Armenians living in Nagorno-Karabakh—supported by the Armenian Armed forces and the Azerbaijan Armed Forces (BBC News, 2018b; Hille, 2016; Department of State, 2016).

The efforts to ensure a peaceful settlement have repeatedly failed despite the urge of countries led by the United States, Russia, and France.

2017-18 GC Ranking

Azerbaijan is ranked 30 this year compared to 27 last year. The ranking has dropped by 3 this year. The culprits seem to result from a decline in these areas: agriculture (30 to 39), environment (58 to 72), governance (80 to 83), and ICT (11 to 22).

Laos

Country Profile

Since the fall of the Soviet Union in the 1990s, Laos began opening its door to the world. However, Laos is still a communist state and remains poor despite economic reforms.

Laos had been a French protectorate between 1893 and 1953. To achieve independence, the Pathet Lao resistance organization formed by the Indochinese Communist Party began the Indochina war against the French Colonial forces with the Viet Minh, the Vietnamese independence organization. In consequence, Laos gained full independence from France as a constitutional monarchy in 1953. Since its independence, the power struggle ensued between royalists and Pathet Lao and Laos was caught up in the Vietnam War. In 1975, communist government replaced the monarchy at the end of Vietnam war (BBC News, 2018a).

To consolidate their revolutionary victory, communist leaders were only allowed to implement limited policies of social and economic liberalization by the end of the 1970s. The New Economic Mechanism (NEM) of Laos can be regarded as one of the major economic reforms which have been implemented in 1986. NEM is a like perestroika, an economic reform program in the Soviet Union; Introducing market incentives and decentralizing government economic enterprise are the main tasks of

this type of reform. With the collapse of communist regimes in the East-Europe bloc and the Soviet Union in the late 1980s and early '90s and the influence of Vietnam's economic reforms, Doi Moi, Laos opened its economy very rapidly (Encyclopedia Britannica, 2018). However, Laos is still one of East Asia's poorest and heavily dependent on foreign aid even though it has a rapidly growing economy over the last decade (Encyclopedia Britannica, 2018).

Laos, officially the Lao People's Democratic Republic (Lao PDR), is surrounded by Myanmar, Cambodia, China, Thailand, and Vietnam. The population of Laos is 6.7 million people; its official language is Laotian; Buddhism is the religion of Laos; the life expectancy is 65 years for men, and 68 years for women. Laos is a landlocked country and its national topography is largely mountainous. Laos has very low agricultural potential because there is only about 4% arable land in Laos. Most of the population lives in rural areas; 80% of the total workforce in agriculture are farmers growing rice (BBC News, 2018b).

The Period between 2016 and 2017: Peaceful Politics and a Growing Economy

Politically, Laos is a peaceful and stable country. The hostility toward foreign companies and businesspersons is low. Even though there were a series of unexplained attacks on vehicles traveling in the mountainous Xaysomboun province in late 2015 and 2016, there were not any reports

of physical and political violence in 2017 or early 2018 across Laos (U.S. Department of State, 2018).

In 2016, Barack Obama made the first ever visit to Laos as a US president and signed a joint declaration of a comprehensive partnership with Laos with Bounnhang Vorachith, the president of Laos. The declaration committed \$90 million in US assistance towards efforts to clear unexploded ordnance (UXO) caused by the heavy US bombing of the country during the Vietnam war and assist UXO victims in Laos. Other aid programs for improving public health were also announced (The economist, 2016).

Laos' economy is one of the fastest growing economies during the last decade; the average GDP growth has been just below 8 percent in the same period. Since 1986 when Laos introduced market reform, Laos has made steady progress in establishing market economy, albeit slowly. To improve the business and investment environment, major reforms of economic and regulatory policies have been implemented by the Lao government. Internationally, Laos gained full membership of the World Trade Organization (WTO) in February 2013 and participated in founding the ASEAN Economic Community (AEC) in 2015. Because the Lao government is pursuing export-led economic development, it is willing to participate in the economic integration of ASEAN.

The state has its huge hydro-electronic

power ambition to become the "battery" of South-east Asia by selling electricity to neighboring countries. In 2017, Laos had 47 dam building projects relevant to hydropower and 23% of its exports was electricity. Laos government expected that hydropower will be the biggest source of its revenue by 2025, but, unfortunately, the collapse of the Xe-Pian Xe-Namnoy hydroelectric dam in July 2018 will be a significant setback to implement Laos's initial plan, as it was designed. Neighbors except Thai and China have continually raised their concerns about the destruction of environment caused by Laos' hydropower projects along the Mekong River.

The Struggle to Improve Government Competitiveness

Laos owes its rapid economic growth over the last decade to the exploitation of natural resources and development of hydropower. Both sectors are highly depending on foreign investment. The government recognizes that growth opportunities in these industries are limited. Thus, Laos is changing its industrial strategy having focusing on these sectors because it recognizes that growth opportunities in these industries are limited; Laos has prioritized a high value agriculture, light industry, and tourism while continuing development of natural resources and improving the capacity of hydro-electric power by building dams (U.S. Department of State, 2018).

Major problems which hamper the economic progress of Laos are the shortage of workers with advanced technical skills,

unstructured school environment, weak health care system, and poor social infrastructure. The government's regulatory capacity is very low, and institutions remain highly underdeveloped and out of dated. Foreign investors and business people's major concern for their business in Laos is corruption at all levels. Laos was ranked 135th of 175 countries in TI (Transparency International) Corruption Perception Index 2017 (CPI, 2017). Also, the uneven applications and ambiguity of relevant laws, policies and regulations are the obstacles to further foreign investment in Laos as well as corruption. The Prime Minister, Thongloun Sisoulith, has publicly declared his goal to improve Laos' the business environment; the current ranking of Laos is #141 of 190 in Ease of Doing Business reported by World Bank (U.S. Department of State, 2018). Laos is marked as 64th of 88 Non-OECD countries in overall government competitiveness. More specifically, the rankings for its input (#46) and outcome (#57) are relatively higher than its throughput (#70) and output (#80). Among the sub-fields, its rankings in environment (#4) and safety (#5) are the highest ones. Especially, the ranking of safety has drastically increased (#46→#5) compared to 2017 because there were no severe physical and political violence between 2016 and early 2018. The ranking of economy is middle upper level (#26). However, the other's rankings are lower than average rankings of Non-OECD; infrastructure (#57), health and welfare (#61), agriculture and food (#75), education (#67), governance (#86), and ICT (#80).

Mongolia

Country Profile

Before 1990, Soviet-style one party system had been the political system of Mongolia for 70 years. However, amidst the decline of communism during the late twentieth-century, the communist dictatorship of this country was successfully transitioned to a multi-party democracy (BBC News, 2018a).

The Mongolian political environment is characterized generally by peace and stability, without severe political conflict with violence, except a brief outbreak of civil unrest caused by disputed parliamentary elections in July 2008. The system of Mongolian government is a semi-presidential system. Recently, Mongolia's parliamentary elections in June 2016 and presidential election in June 2017 led to a transfer of political authority without any severe conflict. Especially, there was not any report for irregular problems about the 2017 presidential race, even though it required a run-off election for the first time (BBC News, 2018b).

Mongolia has experienced fast growing economy because of vast mineral reserves. Its economy growth is highly depending on the foreign direct investment for exploiting its mineral resources. In this line of thinking, it is understandable that the growth of Mongolian economy has slowed over recent years with a drop in foreign direct investment. One of main reasons of Mongolia's declining growth is the lack of foreign investors' confidence about the

country's regulatory policies; There have been great and small conflicts over mining agreements and licensing between foreign investors and Mongolian government until 2016 (U.S. Department of State, 2017). However, Mongolia's current situation for mining issues is very stable because of its government efforts.

The population of Mongolia is 3.1 million people; its major language is Mongolian; Buddhism is the main religion of Mongolia; the life expectancy is 65 years for men, and 75 years for women as of 2017. Once the heartland of the Mongol empire under Genghis Khan, the Mongolia is a landlocked country and its national geography consists mainly of semi-desert and thinly populated steppe. 1.4 out of 3.1 million of people are living in Ulaanbaatar, the capital of Mongolia, 40% of the total workforce are nomads who are herding livestock in pasturelands across the country (BBC News, 2018a).

The Period between 2016 and 2017: Political Change and Economic Downturn

As mentioned, Mongolian democracy has been perceived as stable in general. However, its politics has grown gradually factious; political competition is becoming fierce and the 2017 presidential election was the most heated one in the history of Mongolian democracy. In the last year presidential race, Mr. Battulga, who is an incumbent president, campaigned under the slogan of "Mongolia will triumph." This can be understood as a kind of anti-foreigner slogan against another

candidate who has Chinese blood.

Anti-foreigner sentiment has become prevailing in society in recent years; a more resource-nationalist tone is becoming evident because of the desire to have Mongolian natural resources developed mainly by Mongolians for the benefit of Mongolians, not by foreign investors for their profit. Over the last three years, the level of hostility towards Chinese, Vietnamese, and Korean, not U.S. and western countries, has increased in Mongolia (U.S. Department of State, 2018).

The average growth of economy has been more than 10% per year between 2011 and 2013 - largely on high commodity prices in the world and high Mongolian government spending. However, Mongolian economy has generated less than 2 percent growth rate after 2015, even though its government spending has remained still high. This economic issue is especially linked to the slump of foreign investment in Mongolia because of two reasons; first reason is the falling international price of copper and second reason is foreign investors' concerns about the instability of a country's regulatory framework. Especially, constant amending of regulations and institutions for foreign investment hinders development of a consistent and stable business environment for foreign investors (U.S. Department of State, 2017). In 2017, Mongolia reached an agreement with the IMF a comprehensive USD 5.5 billion package to avoid default caused by its large public debts on the

understanding that it will improve its banking system and seek fiscal reforms (BBC News, 2018b).

Even though Ulaanbaatar is an important economic area, accounting for approximately 64 % of national GDP, rampant poverty persists in Ger districts of Ulaanbaatar. Nearly 60 percent of the city's population lives in poverty in the Ger districts because of the adverse effect of rapid urbanization. Improving the detrimental effects of environmental pollution, underdeveloped infrastructure, and health problems in Ger districts is the important and urgent social issues in current Mongolia (Asia foundation, 2016)

Towards a New Governance to Enhance Government Competitiveness

Mongolia has achieved certain success politically and economically in the last three decades. However, the corruption has been thwarting the development of democracy and economy. Corruption in Mongolia is pervasive across all the way through society at both the "petty" at administrative and "grand" at political and economic elite levels. Mongolia was ranked 103 of 180 countries in Transparency International's 2017 Corruption Perception Index (CPI, 2017). Also, public resources and assets of Mongolia are managed inadequately in many cases because of the huge influence of politics and informal network over governmental activities.

To reduce corruption, Mongolian

government developed a three-year action plan for implementing the National Program Combatting Corruption in March 2017. Also, Mongolia introduced a new criminal code for reinforcing the liability of government officials for corruption and corruption-related offenses, effective July 1, 2017.

Establishing good governance is essential to reduce both “petty” and “grand” corruption by increasing transparency and accountability in Mongolian government activities, which also can increase the efficiency of managing public resources. Furthermore, it will contribute to the sustainability of the country’s long-term economic growth and social well-being.

Ironically, Mongolia has many internationally high-standard institutions and laws which have been imported from developed countries. However, implementing them is a totally different story. They have not been implemented appropriately until now in many cases. Currently, the rapid developments of Mongolian education, public health and ICT are heavily indebted to the international aid agencies which have provided a sufficient fund for improving them with monitoring the spending for the purpose of the fund. Mongolia is ranked 22 of 88 Non-OECD countries in overall government competitiveness. Its ranking has increased by twenty-three notches compared to last year. More specifically, the rankings for its input (#17) and throughput (#15) are relatively higher than its output (#33) and outcome (#30). Among the sub-fields, its

ranking in infrastructure (#16), public health (#10), education (#23), economy (#18), governance (#22), safety (#36) and ICT (#32) are relatively higher than any other fields and agriculture and food (#75) and environment (#44) are lower than the others.

Qatar

Country Profile

Qatar is one of the richest Gulf states today. However, it used to be one of the poorest countries in the middle-east. Before oil reserves were discovered in 1939, pearling and trading were its major industries. Since the end of World War II, oil has become the Qatar's main source of revenue.

During 1950s, Qatar's infrastructure has been expanded and modernized by its oil money. Britain withdrew its force from the gulf and Qatar became independent on September 3, 1971. In 1972, Khalifa bin Hamad Al Thani seized power in a palace coup after infighting in the ruling family. In June 1995, Sheikh Khalifa was deposed by his son, Hamad, in a bloodless palace coup (BBC News, 2018a).

Al-Jazeera was founded as an independent channel funded by the emir in 1996. This famous satellite TV company is based in Qatar, but its programs are broadcasting all over the Arab world. It got a reputation for its willingness to deal with issues deemed as controversial in the region. However, Al-Jazeera can hardly be free from the blame that it was reluctant to criticize Qatar and its Gulf allies. Qatar permitted Christians to worship openly and St Mary's Roman Catholic Church became the first official church in Qatar in March 2008 (BBC News, 2018b).

Politically, Qatar is a stable country and there

are no political opponents like political parties, labor unions, etc. Also, its crime rates are very low (Department of State, 2017). Whether it should be regarded as an absolute or a constitutional monarchy ruled by Al Thani family is disputed because Qatar's first written constitution providing foundation for some democratic reforms was adopted in 2003 and became effect in June 2005. Qatar's constitution provided for the direct election of 30 of the 45 members of the Legislative Council. However, all members of current Council are appointed by the Emir, not elected by the election because legislative elections have been postponed until at least 2019 (Shabina S. Khatri, 2016).

The State of Qatar has the highest per capita income and one of fast growing economies in the world because it is the world's leading exporter of LNG (Liquefied Natural Gas). Compared to other oil- and gas-dependent gulf states, Qatar's economy is relatively free from the impact of the depressed energy prices because its current LNG supply contracts and relatively low production costs have largely protected its economy (Department of State, 2018).

The population of Qatar is 2.7 million people; its major language is Arabic; Islam is the main religion of Qatar; the life expectancy is 78.5 years. Its land is mainly flat and barren desert. The highest point of Qatar, Tuwayyir al Hamir, is only 103 meters. Doha, the capital of the country, is the major administrative and commercial center and most people is living in or around there

(Central Intelligence Agency, 2018).

The Period between 2016 and 2017: A Feud with Neighboring Countries, Human Rights and 2022 FIFA World Cup

Qatar has supported the Palestinian Hamas and Islamist groups in Egypt and Syria financially and logically. The Saudi-led coalition made efforts to force Qatar to abandon its alleged support for terrorism, keep its diplomatic distance from Iran, and close Al-Jazeera. Both sides did not reach any agreement. Finally, Saudi Arabia led an air, land and sea blockade by Arab countries in June 2017; Saudi Arabia, the UAE, Yemen, Egypt, the Maldives, and Bahrain announced that they were cutting diplomatic ties with Qatar.

Amid this ongoing diplomatic crisis with other Arab and other countries, the Qatar's real gross domestic product (GDP) estimated by IMF (the International Monetary Fund) is 3.1 percent in 2018 (2.55 percent for 2017). Qatar is expecting its budget deficit in 2018 mainly because of lower oil and gas prices. However, maintaining high levels of government spending for achieving its National Vision 2030 development plan is another reason of its budget deficit this year (Department of State, 2018).

Also, it is still controversial for Qatar to win 2022 FIFA World Cup bid in terms of the fairness of the bidding process and the suitability of Qatar as a host country. Many

media outlets have made numerous allegations of bribery between the Qatar bid committee and FIFA. In addition, the very hot and humid local climate in summer, the high expected cost, limited football history and its human rights record have been pointed out as the grounds for disqualification of Qatar as a host nation.

In 2016, the Amnesty International reported that migrant workers working on construction sites for the 2022 FIFA World Cup or other domestic sectors, face forced labor by “Kafala” system. It is because this sponsorship system required unskilled migrant workers to have an in-country sponsor, mostly their employer, who can have the whip hand over their visa and legal status (BBC News, 2018b). Even though, Qatar government says it is abolishing this controversial sponsorship system and introducing a new law to make it easy to change jobs or leave the country, the Amnesty International said changes were insufficient (Al-Jazeera, 2016).

Towards a National Vision for 2030

Qatar government is still the dominant actor in its economy, though it takes steps to encourage private investment in many sectors and more foreign investment. Qatar government's procurement processes have been updated with an online portal for monitoring all government transactions for improving transparency. Also, the government enacted a regulatory regime to curb corruption and anti-business friendly practices. Qatar was ranked 29th of 180

countries in TI (Transparency International) Corruption Perception Index 2017 (CPI, 2017). Also, Qatar's current ranking is #83 of 190 in Ease of Doing Business reported by World Bank. The oil and gas sector has been the dominant driver of Qatar's economy until now. According to its National Vision 2030, Qatar has a plan to pursue an advanced, knowledge-based, and diversified economy (U.S. Department of State, 2018).

In terms of safety, the U.S. government believes there is the possibility for acts of transnational terrorism to occur in Qatar (U.S. Department of State, 2018). The ongoing struggle between Qatar and the Saudi Arabia-led bloc of states, sometimes called as the "Second Arab Cold War," increase the tensions in the Gulf. In addition, natural disasters are not urgent and serious problems for Qatar. However, the government needs to prepare for the desertification caused by climate change; Qatar launched the project to build huge artificial forests in the north side of Doha from 2015 to 2016 (Varghese, J., 2016). Qatar's government competitiveness score is top level in Non-OECD; its overall ranking is the sixth place of 88 Non-OECD countries even though its ranking has dropped by 3 places from last year ranking. Specifically, the rankings of its input (#10), throughput (#8), and output (#8) made top ten on Non-OECD countries except its outcome (#12). Among the sub-fields, its ranking in infrastructure (#2), safety (#4), economy (#2), education (#8) and ICT (#3)

are the highest ones among all Non-OECD. Environment (#87) is lowest ones compared to the other fields because of a large-scale construction project for 2022 world cup.

1. Non-OECD Countries: Central & South America

Bolivia

Country Profile

Bolivia boasts a rich array of resources. The country possesses the second-largest reserves of natural gas in South America and is the largest producer of coca, the raw ingredient for cocaine. The country is home to 11.3 million people (2017 Revision of World Population Prospects); its main languages include Spanish, Quechua, Aymara, and Guarani; Bolivians mainly believe in Christianity; typical Bolivian men are expected to live 66 years while Bolivian women's life expectancy is about 71 years (BBC News, 2018a).

Gaining independence in 1825, Bolivia has experienced both military and civilian rule. The current President of Bolivia is Evo Morales. He has served in that capacity since December 2005. He was the first Bolivian president coming from the indigenous majority. He started with radical visions to change the country's deep social divisions and inequalities. His leadership combined left-wing ideals with traditional Andean values. In the middle of 2006, Morales nationalized oil and gas sectors in Bolivia. With the money from natural resources, Morales has invested heavily in social

programs (such as reducing poverty) and infrastructures (BBC News, 2018b).

In February 2016, Morales lost a referendum by which he could run for president for a fourth term. Still, his party, Movement for Socialism, nominated him again for president in December 2016. The legality of this attempt was questioned and the Supreme Tribunal of Justice of Bolivia ruled that all public offices would not be restricted to term limits (The Editorial Board, 2017).

The Period between 2016 and 2017:

Entrenched Leadership

In February 2016, President Morales announced that he would follow the voice of Bolivians after a referendum that rendered him not eligible to run for a fourth term. But in 2017 he and his party began to devise a plot that would allow him to serve a fourth term. He accused that the referendum was tainted with false information to undermine him. Once wildly popular among Bolivians, people soured on him after a scandal in which millions of government money were funneled into a Chinese company where his girlfriend worked. The scandal symbolized corruption of the Morales regime. But, instead of owning and acknowledging it, Morales and his political allies imprisoned

the girlfriend, Gabriela Zapata, to keep her mouth shut (The Editorial Board, 2017).

Indeed, Bolivian Congress dominated by the majority party, Movement for Socialism, nominated him for a presidential candidate and the Supreme Tribunal of Justice of Bolivia made an odd decision that took term limits off all public offices (The Editorial Board, 2017).

Miners' Strike and the Kidnapping of the Deputy Minister

In August 2016, Rodolfo Illanes, Deputy Interior Minister, was kidnapped in Panduro and killed. Illanes was alleged to be beaten to death and the government arrested about 100 miners (Reuters, 2016).

The kidnapping and subsequent killing occurred after the government's negotiation with miners collapsed. After the collapse, the National Federation of Mining Cooperatives of Bolivia warned that there would be a prolonged protest against the government. The protesters demanded more union representation, the right to work for private corporations, and more mining concessions. The significant number of miners works in cooperatives, producing likes of silver, tin, and zinc. The miners became increasingly sour on the Morales regime after falling natural gas prices led to austere spending, given that natural gas accounted for the half of Bolivia's total exports (Reuters, 2016).

A Locust Plague, Drought, and Climate

Change

In early 2017, the Bolivian government declared a state of emergency due to locusts swarming agricultural areas. The locusts devastated over 1,000 hectares of agricultural land, mainly in Santa Cruz (Reuters Staff, 2016).

The disaster was preceded by significant drought, the worst in the last 25 years. According to Vice Ministry of Civil Defense, the drought influenced approximately 125,000 families and threatened over 290,000 hectares of agricultural areas along with over 360,000 heads of cattle. The drought signals a particularly worrisome trend: climate change. La Paz and El Alto, the two largest cities in Bolivia, draw most water supply from the glaciers of the Andean mountains. Unfortunately, these glaciers are shrinking badly. The three main dams holding water for the two cities run dry. La Paz began water rationing and the poor of El Alto demonstrated against a short supply of water. The government came with short-term measures such as closing schools two weeks ahead of schedule, drilling emergency wells, and using the army to distribute water. But it is doubtful that these measures would counter the long-term trend of shrinking snowline (Rocha, 2016).

In fact, one glacier over Chacaltaya mountain already was gone in recent years and the two Tuni-Condoriri glaciers lost 39% of their mass between 1983 and 2006. To make matters worse, El Alto's population jumped by more than 30% between 2001 and 2012

alone (Rocha, 2016).

64).

Facing daunting challenges, Bolivia may have to come up with new ideas to address the impact of climate change and exploding population in the cities; it has not only to reduce water consumption through collaborative governance involving the government, affected communities, industries, and lavish domestic customers, but also to make concerted efforts to conserve and recycle water (Rocha, 2016).

Doubling the Area for Planting Coca

In March, 2017, Bolivia doubled the area where coca can be legally planted. Previously 12,000 hectares of land was devoted to cultivating coca, but President Morales signed into law a bill that allowed 22,000 hectares of land for coca. Opposition of the bill claimed that the act was illegal and would facilitate the illegal drug trade; they also argued that promoting coca contradicted international treaties. While the plant was known for being a major ingredient to cocaine outside South America, coca was used for a long time to make tea or to be chewing for mild stimulation (Lui, 2017).

2017-18 GC Ranking

Bolivia is ranked 52 this year compared to 46 last year. The ranking dropped by 6 this year.. Still, the drop may have resulted from a decline in these areas: agriculture and food (57 to 76), economy (32 to 44), education (22 to 39), governance (32 to 43), public health and welfare (43 to 49), ICT (59 to 61), infrastructure (52 to 75), and safety (56 to

Costa Rica

Country Profile

Costa Rica is considered one of the most politically stable and economically prosperous countries in Latin America. Still, the country is not without the poor. The country is also unique in that it is without a standing army, abolishing it in 1948. The country's rich coastlines, mountains, and biodiversity attract a huge number of eco-minded tourists. It used to mainly produce bananas and coffee, but the country has undergone economic diversification and tourism is now no.1 contributor to national coffers. The country also boasts strong press and is considered one of the best countries in Latin America where freedom of expression is cherished (BBC News, 2018a).

Costa Rica gained full independence in 1838 after the United Provinces of Central America, of which it was part, was disintegrated. In 1948, the country adopted a new constitution while dissolving its standing army. In 2010, Costa Rica had its first female president in Laura Chinchilla (BBC News, 2018b).

Costa Rica is home to 4.97 million people (2017 Revision of World Population Prospects); its main languages include Spanish and English; Costa Ricans mainly believe in Christianity; Costa Rican men are expected to live 77 years while women's life expectancy is 82 years (BBC News, 2018a).

The country's current president is the center-

left Carlos Alvarado. He won the presidential election in March 2018 by a wide margin. He previously served as Minister of Labor as well as of Social Security (BBC News, 2018a).

The Period between 2016 and 2017:

The Impact of Tropical Storm Otto

Costa Rica was hit by Tropical Storm Otto in November 2016. The storm poured down a month-worth rain in a few hours. It killed nine people along with collapse of small bridges and over 5,500 residents had to be evacuated. It was the first hurricane to hit Costa Rica since records began in 1851. The storm hit Bagaces and Upala particularly hard. President Luis Guillermo Solís announced three days of mourning for those devastated by Otto (BBC News, 2016).

Collaboration with the United States on Reducing Drug Trafficking and Refugees

In June 2016, the United States government donated two vessels to the Costa Rica Coast Guard. Worth \$19.5 million in USD, the 110-foot ships will be the largest among those owned by the Costa Rica Coast Guard. These vessels will help fight drug trafficking in the Pacific as well as illegal fishing. 50 Coast Guard officers were invited to Baltimore in the United States for training. The Costa Rica Coast Guard boasts the best record of intercepting drugs in the region and the donation is considered as a collaborative measure between Costa Rica and the United States to fight against drug trafficking and recognize Costa Rica's role in that regard (Dyer, 2016).

The collaboration with the United States continued with respect to refugees. In July 2017, the Obama administration (of the United States) announced the agreement with Costa Rica that the latter would offer protections for refugees fleeing from Central America on their way to the United States (Holpuch, 2016).

The number of people fleeing from Central American countries such as Honduras, El Salvador, and Guatemala has dramatically surged; in fact, it increased five times between 2012 and 2015. Violence from the Northern Triangle has been vicious and the number of refugees spiked to over 110,000 in 2015 (Holpuch, 2016).

Gangs have pulverized communities; they have targeted, killed, and raped them for ransom payments. Costa Rica will accept 200 refugees at a time for six-month periods. U.S. state department officials will prescreen refugees in their own countries and, then, they will travel to Costa Rica where refugees will undergo immigration processing before their eventual settlement in the United States (Holpuch, 2016).

The cooperation followed the similar agreement between the United States and Mexico to expand the latter's asylum capacity a week before (Holpuch, 2016).

Flourishing Ecotourism

In recent years, Costa Rica has been a global leader in ecotourism. The country boasts an impressive array of beaches, mountains, and

bio-diverse reserves. In 2016, approximately 2.9 million tourists visited the country and the estimate reflects a 12.8% increase over 2015. American visitors constitute a substantial part of the tourists with approximately 1.2 million visitors (Glusac 2018). The popularity stems from the country's proximity to the United States, the availability of nonstop flights, and Costa Ricans' willingness to speak English to visitors.

Further allure of Costa Rica as an eco-tourism destination is that the country is small enough to permit the tour of multiple locations in one day whether it is cloud forest, rain forest, or coastal mangrove. The fact that the country is a neutral country with no standing army and a higher quality of living compared to other Latin American countries is also a plus for tourists (Glusac 2018).

Ecotourism began to explode in the 1990s and serves as a leading economic engine for Costa Ricans. Costa Rica created its first park in 1971 and it now boasts 70 preserves over 3.2 million acres. Costa Rica's impeccable reputation with respect to carbon footprint is also notable. The country derives 90% of its electricity from renewable energies and 26% of the country's land area is protected natural land (Glusac 2018).

2017-18 GC Ranking

Costa Rica has been one of the best countries when it comes to government competitiveness. It is ranked 5th this year

compared to 4th last year. The slight decline may be explained by a decline in the following areas: agriculture and food (14 to 15), economy (8 to 21), education (6 to 15), environment (3 to 9), governance (3 to 2), public health and welfare (10 to 11), ICT (14 to 9), and infrastructure (20 to 34).

Paraguay

Country Profile

Paraguay endured 35-year military dictatorship under General Alfredo Stroessner between 1954 and 1989. Since then, political unrest, poor economy, and chronic corruption have wreaked havoc on the young, fragile democracy. Over 40% of people live in poverty. Most land of the country is owned by a minority group of elites and land reform efforts have been painfully slow. Its major economic sources are derived from agricultural products and hydroelectric power. Recent surge of mass tourism, which benefited Paraguay's neighbors, also eluded the country (BBC News, 2018a).

Paraguay is home to 6.9 million people (2017 Revision of World Population Prospects); its major languages include Spanish and Guaraní; Paraguayans mainly believe in Christianity; Paraguayan men are expected to live 71 years while women's life expectancy is 75 years (BBC News, 2018a).

Paraguay gained independence in 1811. In modern times, Gen. Stroessner rose to power in coup and ruled the country for 35 years. Although he was deposed by another Gen. Andres Rodriguez-led coup in 1989, Stroessner-backed Colorado Party still dominates parliamentary elections. The country adopted the new democratic constitution in 1992. In May 2000, a coup attempt was defeated. In 2002, President Gonzalez Macchi survived an impeachment

over his involvement in corruption. Starting in April 2004, farmers began to demand reforms that could help redistribute the land. In 2008, Fernando Lugo, a former left-wing bishop, took over the government, ending the 60-year-old rule of the conservatives. But President Lugo was ousted over his handling of a land dispute that resulted in 17 people killed (BBC News, 2018b).

Lugo was followed by Horacio Cartes. The latter was one of the wealthiest persons in Paraguay. He was given new powers to use the military against left-wingers. Once in power, he tried to change the national constitution so that he could be up for reelection, but the attempt backfired, sparking deadly political unrest. Consequently, he was forced to not to run for reelection, helping defuse political tensions (BBC News, 2018b).

The current president of Paraguay is Mario Abdo Benitez. Elected in April 2018 and inaugurated in August as the President, he was a former senator. His victory continued the grip of the conservative Colorado Party, which has dominated Paraguayan politics for years (BBC News, 2018a).

The Period between 2016 and 2017:

A Manufacturing Boom

In recent years, Paraguay has become a manufacturing hub. Since 2013, the country has attracted many foreign factories due to new incentives provided to them. Particularly notable were Brazilian companies believed to be fed up with high taxation and byzantine

labor rules. Ranked 123rd of 190 in the World Bank's business climate survey in 2017, Brazil has been known to have business regulations that make it difficult for businesses to hire and fire employees; businesses are also subject to up to 35% tax on imported goods; they also face a legal system that encourages employees to sue their employers. All these in combination with continuous political scandals have sapped any semblance of entrepreneurial spirits in Brazil (Lewis 2017).

Paraguay has had its share of defects for decades. Ruled by General Stroessner for 35 years, the country has also been known for corruption as well as drug and armament trafficking. But the country began to woo foreign manufacturers in 2001 and the effort escalated in 2013 when President Cartes rose to power. The effort to seduce foreign manufacturers consisted of multi-pronged incentives: inexpensive electricity, less complicated labor rules (at least compared to Brazil), no tax on imported goods, and a 1% tax on finished exported goods. The so-called *maquila* program has attracted 115 factories, of which 89 have been opened since 2013. These foreign manufacturers accounted for approximately 13,000 jobs (Lewis 2017).

Still, the country may face some limitations. It is at the mercy of Brazil for foreign investment as well as its transit infrastructure that connects to Brazilian export ports (Stratfor 2016). Consequently, Paraguay can be exposed to Brazil's boom and bust cycles.

In addition, most workers are unskilled and, as such, there is less economic potential for areas beyond agricultural, textile, and certain automotive industries. Economic growth, last all, is heavily concentrated in the two major cities, Asuncion and Ciudad del Este. Most land including environmentally protected Alto Paraguay is as secluded as an area can be from the outside world (Stratfor 2016).

Agricultural Growth, but Persistent Poverty

In addition to manufacturing, Paraguay has experienced a robust success in the agricultural sector. Over the last two decades, the country has become a major food exporter; it is no.4 exporter in soy, no.6 in corn, and no. 10 in wheat in the world. The substantial growth can be attributed to improved farming efficiency and technology (Cabral 2017).

Despite the agricultural prosperity, many Paraguayans still suffer from malnutrition and hunger. Based on a United Nation estimate, approximately 45% of Paraguayan children are exposed to malnutrition. The poverty, in turn, results from lack of education and work opportunities. Congress is considering a tax raise on agricultural products to fund welfare obligations, but farm producers argue that increasing taxation will burden exporters and weaken their ability to remain competitive in the global market. A major challenge for Paraguay seems to be how to balance global competitiveness as a goods exporter and

poverty and malnutrition of many Paraguayans at home (Cabral 2017).

Constitutional Crisis Surrounding the Presidential Reelection

President Cartes defused a constitutional crisis by announcing in April 2017 that he wouldn't run for reelection. The crisis stemmed from a secret Senate vote on constitutional amendment that would allow former presidents to run for reelection. Passed in 1992 a few years after the 35-year military rule ended in 1989, the Constitution prohibited presidential reelection and limited the president to a single five-year term (Mander, 2017a and 2017b; BBC News, 2018b).

The secret vote soon sparked national political unrest and enraged Paraguayans let their ire known by setting part of congressional building ablaze last March (Mander 2017). Business groups also persuaded President Cartes, one of the most successful businessmen in the country, not to stimulate unrest and devastate the market where, for instance, Paraguay is the no.4 exporter of soy in the world (Mander, 2017a and 2017b).

In recent years, various countries in the region have tried to amend their own constitution to allow a presidential reelection; some have succeeded (Columbia and Venezuela) while other have failed (Chile and Peru).

Through the reelection bid, President Cartes

hoped to further deepen business-friendly climate he installed. Indeed, Paraguay has enjoyed a 4.5% growth rate for the last ten years while countries such as Brazil and Argentina have been exposed to major recessions (Mander, 2017a and 2017b).

2017-18 GC Ranking

Paraguay is ranked 33rd this year compared to 40th last year. The ranking has increased by 7 this year. The better ranking may be explained by accompanying improvements in these areas: education (41 to 29), environment (23 to 10), governance (17 to 16), and infrastructure (43 to 40).

Peru

Country Profile

Peru boasts rich cultural heritage that contains both Incan capital of Cuzco and the lost city of Machu Picchu as well as the world's highest lake, Lake Titicaca (BBC News, 2018a).

The country in recent years has attracted a sizable number of foreign investors who are interested in exploiting its rich mineral deposits. The country is also the largest producer of cocaine. Peru is still suffering from the two-decade political struggle between the government and leftist guerrilla groups, the Tupac Amaru Revolutionary Movement and the Shining Path (BBC News, 2018a).

Peru is home to approximately 32.7 million people (2017 Revision of World Population Prospects); its main languages include Spanish, Quechua, Aymara; Peruvians mainly believe in Christianity; average men are expected to live 72 years while women's life expectancy is about 77 years (BBC News, 2018a).

Peru gained independence from Spain in 1824. Peru lost its territory when it along with Bolivia lost to Chile during the Pacific War (1879-83). The country has experienced frequent political turnovers back and forth between military rule and civilian rule since 1948. The particularly notable is the political struggle between the state and leftist guerrilla groups that spanned two decades between

1980 and 2000. It is estimated to have claimed 70,000 Peruvians. President Alberto Fujimori served as the President of Peru between 1990 and 2000; he was ousted by Congress and jailed for abuse of power and accusations of death squad killings (BBC News, 2018b).

Pedro Kuczynski won presidency in April 2016, defeating Keiko Fujimori, daughter of the imprisoned former president Alberto Fujimori. In December 2017, Fujimori was pardoned for health reasons. Vice-President Vizcarra became the President of Peru in March 2018 after President Kuczynski resigned facing corruption allegations (BBC News, 2018a).

The Period between 2016 and 2017:

Corruption

Corruption continued to permeate Peruvian politics. Peruvian prosecutors charged former president Alejandro Toledo (2001-6) for accepting \$20 million from Odebrecht, a Brazilian construction firm. Toledo himself rose to power after leading protests against Alberto Fujimori. Odebrecht was also implicated in the Brazilian corruption scandal that involved members of the administration of Luiz Inácio Lula da Silva. The Department of Justice in the United States identified that Odebrecht operated a division dedicated to bribing government officials across countries. Prosecutors in Peru already tracked \$11 million in an offshore account held by Toledo's friend, Josef Maiman (Zarate, 2017).

Speaking of corruption, Peru had four of its former presidents in jail. Aside from Alberto Fujimori and Toledo, an Italian court sentenced Francisco Morales Bermudez, a military dictator from 1975 to 1980 for his role of having 23 Italian nationals die. They died during Operation Condor, a right-wing terrorism campaign across Latin America with the assistance of the United States. Ollanta Humala, President Kuczynski's predecessor, was also imprisoned for money laundering, conspiracy charges, and his role in extrajudicial killings when he was an army captain in the 1990s (Goldenberg, 2017).

Peru lacks the system to ensure that funding for presidential elections are transparent. In fact, Peruvian presidential elections have been funded by George Soros as well as Brazil and Venezuela. However, President Kuczynski did not lay out specific strategies to reform electoral and judicial institutions. And Congress is ruled by the opposition party whose leader is Keiko Fujimori; the latter's presidential campaign was marred by accusations of illegal money as well (Goldenberg, 2017).

Mining Exploitation: Farmers and the Peruvian Government Taking a Stand

Peruvian farmers in recent years were engaged in sharp disputes against gold mining corporations. Farmers have long complained that private security forces backed by mining firms attacked them for their protests. Those supporting land rights of farmers have argued that mining firms have prioritized eviction and litigation over

conversations and negotiations with farmers. The standoff between farmers and mining firms started in 2011 when Minera Yanacocha tried to purchase a track of land to build a gold mine (Arsenault, 2016).

On the other hand, the Peruvian government is also working to expel illegal miners from the Tambopata reserve, one of the most bio-diverse areas in the world. Gold price was high in recent years, prompting illegal miners to extract gold across Latin America. The problem is particulate acute in Peru, a major gold producer in the world. The number of illegal miners was palpable in Peru. According to Victor Torres Cuzcano, an economist, illegal, unregistered miners increased by 540 percent between 2006 and 2015 (Daley, 2016).

Miners' use of mercury raises a significant health concern; tests in 97 villages showed that more than 40% of the people absorbed dangerous level of heavy metal. The Peruvian tax authority calculated that over \$1 billion worth of gold was gone due to illegal gold mining between February and October 2016 alone. The government tried to stop illegal mining, but they were outgunned and underequipped; just for the Tambopata reserve, there are about 100 armed marines and rangers while there are over 5,000 and perhaps 10,000 illegal miners. The government seemed to be content with destroying dozens of mining camps with no arrests of illegal miners (Daley, 2016).

2017-18 GC Ranking

Peru is ranked 25th this year compared to 36th last year. It reflects an improvement by 11 this year. The better ranking seems to result from improvements in the following areas: economy (9 to 4), governance (22 to 19), public health and welfare (46 to 37), ICT (49 to 29), and infrastructure (46 to 35).

1. Non-OECD Countries: Europe

Romania

Country Profile

Romania is the largest country among the Balkan nations. Surrounded by mountains and the Black Sea, the country has experienced dramatic ups and downs in its history. Romania has approximately 19.6 million people; its main language is Romanian; Romanians mainly believe in Christianity; Romanian men are expected to live 71 years while the life expectancy of Romanian women is 78 years (BBC News, 2018a).

Romania was under the Roman and Ottoman to the Austro-Hungarian empires. After the World War II, communist regime ruled the country until people rose against it in 1989. Romania joined NATO in 2004 and the European Union in 2007. In 2009, Romania facing a significant financial crisis had to borrow from the International Monetary Fund \$20 billion Euros. Subsequent austerity measures—such as wage and pension cuts to public employees—as well as government corruptions have led to frequent protests and culminated in large-scale demonstrations (unseen since the fall of the communist regime) in early 2017 (BBC News, 2018b).

Romania runs a semi-presidential representative democracy. The President is elected by a popular vote and the President, in turn, nominates the Prime Minister in consultation with the majority party. The current president is Klaus Iohannis who previously assumed the provincial mayoralty of Sibiu in Transylvania and defeated the ten Prime Minister Victor Ponta. He is an independent and supported by the National Liberal Party. The Prime Minister is Viorica Dancila of the Social Democratic Party (BBC News, 2018a and 2018b).

The Period between Summer 2016 and Spring 2017:

NATO Missile Defense System

In May 2016, Romania installed a land-based missile defense system with the aid of the United States. Called the Aegis system, it helps protect NATO allies from potential missile attacks by the Middle East and Russia. Russia clearly regarded the system as a national security threat (BBC News, 2016).

Despite NATO and American assurances that the system was too close to Russia to intercept potential Russian missiles and that it was designed to prevent short- and medium-range attacks from the Middle East,

Russia's suspicion has not abated. And, in the long run, the installation may lead to military tensions between Russia and Romania as part of NATO (BBC News, 2016).

Demonstrations against Government Corruption

Amidst austerity measures and government corruptions, people of Romania took to the streets across the country for more than a week in late January and early February 2017. The demonstrations revealed the deep distrust Romanians had toward the government. Demonstrators called for the resignation of Prime Minister Sorin Grindeanu and the presidents of the Chamber of Deputies and the Senate. The previous resignation of Florin Iordache, the minister of justice, did not lessen Romanians' built-up anger and frustrations. Behind the anger was a long history of government corruption and a government emergency decree that betrayed Romanian's yearning for clean politics (Gillet, 2017).

Corruption is "endemic" in Eastern Europe and Romania has had a long history of fighting against corruption. The emergency decree would have decriminalized certain corruption practices mainly concerning abuse of power, further angering the public. The government quickly revoked the decree, but the anger didn't dissipate. The decree immediately could have helped Liviu Dragnea, the leader of the Social Democratic Party who could not serve a public office due to the 2001 act that barred politicians with convicted crimes from assuming public

offices when Romania prepared itself for joining the European Union (Gillet, 2017).

Many Romanians were clearly frustrated with corruption and bribery in everyday life from hospitals to schools and government offices (Karasz, 2017a). For instance, there was a prevailing practice of bribing doctors; doctors prioritize patients offering money over those without it. People believed that nothing could be done unless officials offering public services were bribed. A university professor noted that many professors were engaged in selling papers and offering made-up grades to students (Karasz, 2017a). The prevalence of nepotism and graft was long blamed for social and economic inequality (Geoana, 2017).

In the aftermath of the demonstrations, Sorin Grindeanu was forced out of the Prime Minister office in June 2017, but Mihai Tudose, who replaced him, also disappointed many reformed-minded Romanians. He already surrendered his doctoral degree after receiving plagiarism accusations in 2016 (Karasz, 2017b).

The spate of demonstrations against corruption will continue in Romania in the struggle against it for a long time. Whether government will take notice of the public and take reform actions for transparent politics remains to be seen.

2017-18 GC Ranking

Romania is ranked 8th this year compared to 9th last year. The slight jump may be

explained by improvements in the following areas: economy (16 to 12), governance (10 to 6), public health and welfare (48 to 30), and infrastructure (33 to 30).

2. Korea: Government Competitiveness of Korea in 2018 and Specific Issues during 2016-2017

Overview

The overall Government Competitiveness (GC) ranking of Korea this year is 25th in the Organization for Economic Cooperation and Development (OECD) countries. This result indicates a break from the decline over the past three years: 27th in 2017, 21st in 2016, and 16th in 2015. The fields that overall improvement occurred are Culture & Tourism (14th in 2018←21st in 2017), ICT (11th←16th), R&D (19th←21st), and Safety (5th←21st) fields. In contrast, Economy (14th←9th), Education (31st←27th), and Environment (30th←21st) fields have worsened.

Korea has typically been sensitive to changes and discussions in the Information and Communication Technology (ICT) field including the issue of the fourth industrial revolution. Since the GO match between AlphaGo (artificial intelligence program (AI) developed by Google company) and Lee Sedol in Seoul on March, 2016, Korean government has realized especially the importance of AI technologies and its applications in our everyday lives as well as in business. For instance, governmental investments with regard to the development of source technology in the Internet of Things (IoT) have increased 197.9 percent

from 7.2 million dollars in 2016 to 21.5 million dollars in 2017. In other words, the ICT policy arena of Korea has shifted from traditional manufacturing to a sustainable competitive advantage in software products and services in order to initiate a change in the industrial framework that will become visible in the future via the intelligence information community or the fourth industrial revolution (KISDI, 2016). Nevertheless, government's institutional efforts such as the enactment of laws relating to ICT, intellectual property protection, or software privacy rate will be also required to facilitate the development of source technology in the ICT field (KERI, 2016).

The ranking of government competitiveness in Research and Development (R&D) in 2018 has been dramatically improved from the previous year. In particular, the ranking of GC sub-index with governmental R&D has moved up from 20th to first. The Korea's total spending on R&D including public and private R&D expenditure ranks fifth in the world. In addition, the ratio of total R&D spending to the GDP (called R&D intensity) of Korea ranks 2nd in the world, contending with Israel for the best.

Source: OECD main science and technology indicators (unit: %)

Figure 1. Trends in the Ratio of R&D Spending to the GDP of Major Countries

However, the growth rate of public spending on R&D, excluding private expenditure that accounts for three-quarters of the total spending, shows a marked decline during 2009-2018. That is, given inflation, Korea government's growth rate of public spending on R&D (0.7% in 2016, 2.4% in 2017, 1.1% in 2018) indicates that it is actually stagnating or declining. In order to cope with the huge epochs of the 4th industrial revolution under the constraints of the government's R&D spending, innovative transformation would be required in the government's R&D system and the related institutions.

Source: NTIS, Science and Technology Statistics

(unit: hundred million won, %)

Figure 2. Size and Annual Growth Rate in Korea's R&D Spending

The field of Culture and Tourism in Korea has been being promoted despite its lack of resources. For example, the Bangtan Boys (*a.k.a.*, BTS), a Korean boy band, has scored No. 1 twice on the Billboard chart 2018. BTS is the first Korean singer to enter 'Billboard 200' chart, and one of their songs, *Idol*, was ranked 21st in the U.K.'s official single chart. In addition, BTS made it to the global music streaming web service Spotify's 'Global Top 50' chart, which is popular in the Americas, Europe, Hong Kong, Australia, New Zealand, Philippines, etc.

Although these achievements are in large part related to an individual's or an individual company's ability, Korean government has also played a role in promoting cultural policy to the world, e.g., Korean Wave (*Hallyu* in Korean). For instance, Korea's Ministry of Culture, Sports and Tourism has built an export information platform based on big data and strengthened the *Hallyu* network by expanding overseas *Hallyu* communities and reporters (KOFICE, 2017). In addition, Korean government has created a visa program (called *Hallyu* visa) linking the Korean Wave and its related industries such as K-pop concerts and beauty and cultural experiences in order to increase tourist traffic from overseas.

Source: Korea Tourism Organization (unit: million)

Figure 3. Number of Foreign Visitors to Korea

Nevertheless, some improvements for customers with regard to *Hallyu* contents will be needed to spread *Hallyu* to the world. For example, the most inconvenient issue for foreign customers in using *Hallyu* contents is lack of multilingual information (KOFICE, 2018). In addition, the customers point out that there is not enough opportunity for them to experience Korean pop culture. The government's support for these issues would be a necessary part of strategies to drive growth in cultural tourism in the near future. Meanwhile, Korea's ranking of government competitiveness in Education has fallen to 31st in 2018 from 27th in 2017 among OECD countries. In Korea, it is no exaggeration to say that the college and university entrance system is all about the national education system because college entrance exam (like SAT) scores and each student's college or university admission may become a cause of deepening social polarization. This is due to the fact that the college admissions process has turned into a lengthy, complex and costly proceeding, and those who cannot afford this process may have a disadvantage in entering a prestigious

college in Korea. Accordingly, it seems clear that the government should play a role in strengthening public education systems and providing fair quality education for all.

Nevertheless, in particular, the college and university admissions policies of the Ministry of Education have been criticized by many citizen societies, parents, and students who even support the ruling party and the current government, because of the Education Minister's frequent turnaround, avoidance of responsibility, and fomentation of policy confusion (Sisa Journal, 2018). Although not easy, it seems an urgent necessity for Korea to build a new social consensus on the purpose of education itself and design education policy accordingly.

With regard to GC sub-index with Economy, Korea ranks 14th in OECD countries. More specifically, while the economic growth rate rose slightly to 3.1% in 2017 from 2.8% in 2016, the ranking of sub-sub-index of Economic Fundamental has fallen to 18th from 5th, which indicates that the difference from the previous year in economic growth rates is relatively smaller than competitor countries. In contrast, the ranking of sub-sub-index of Economic Institution & Policy has improved rapidly, which implies that newly designed economic policies, e.g., tax equity, give a positive signal to society. For example, the issue of economic equality has been of great interest since the general election of 2016 and the Korean presidential election of 2017. Consequently, a lot of economic-related issues have been surfacing

across the country. Those issues are elaborated as below.

Work and Life Balance: Weekly 52-hour System and An Increase in the Minimum Wage

Work/life balance (WLB) is an emerging topic in today's fast-paced society, but its meaning is not clear and seems to be differently understood among different societal actors (Lockwood, 2003). Nevertheless, WLB has been considered as the balance or fit between time allocation for work and other aspects of private lives, encompassing a family-friendly perspective such as flexible working hours and homeworking (e.g., White et al., 2003). WLB has been also defined academically as “satisfaction and good functioning at work and at home with a minimum of role conflict” (Clark, 2000: 751).

In the context of living in an increasingly connected society in which the development of ICT keeps us in touch with work at all times, achieving perfect work-life balance seems to be hard.

Whereas WLB was first used in U.K. and U.S. in the late of 1970s and 1980s, it appeared as a new word in the Korean workplace 2016 (e.g., Financial News, 2016). The OECD's Better Life Index presents that Netherlands had the best work/life balance of the 38 OECD countries in 2017, while Korea was ranked 35th among them. On average, 20.8% of employees in Korea work very long hours totaling more than '50 hours' per week,

compared to just 0.5% of workers in Netherlands (OECD average of 13%).

According to 2010 National Health Interview Survey Occupational Health Supplement data, 16% of U.S. workers reported the imbalance between work and family. In Korea, even though the five-day workweek system (or weekly 40-hour system) has been employed since 2003, extra work (overwork) is still not unusual these days. The survey report 2016 of the Korea Chamber of Commerce and Industry (i.e., Report on Corporate Culture) indicates that the average number of working nights per an employee is 2.3 days a workweek (i.e., five days) and the proportion of working overtime for three or more days is 43.1%.

Many studies have pointed out the negative effects of work/life imbalance such as job dissatisfaction, withdrawal attitudes, and mental health problems (e.g., Hämmig & Bauer, 2009; Hughes & Bozionelos, 2007). Accordingly, employees' perception with regard to overwork and overtime has continuously changed. Some workers start to take full advantages of the WLB policies and benefits available. In particular, with a focus of governmental and public organizations, the government is promoting WLB policies (e.g., family-friendly management program) in order to extend this approach to the private sector. Thus, political pressure for legislation to promote WLB has come since its appearance in 2016, and finally the Labor Standard Act has been amended in February 2018 and implemented this July 1st 2018.

That is, employees in Korea cannot work more than 52 hours weekly any more.

Along with WLB, a minimum wage policy especially for low-income workers has been a hot issue because a reduction in working hours (i.e., due to 52-hour maximum working week) may lead to a decline in workers' wages.

Since South Korea's Minimum Wage Commission (MWC) was established in 2000, the decisions of the Commission board have never been easier. The MWC includes representatives of labor and management, as well as the general public members. Therefore, their most negotiations have been barely limping along. Nevertheless, the minimum wage was increased by 16.38 % in early 2018 and will increase to 8,350 won (10.89%) in 2019, while being increased by around 7-8% annually before 2018.

The Moon Jae-in administration has designed the minimum wage policy considering 52-hour maximum working week in order to push for 'income-led growth'. This strategy for growth stresses that an increase in household income will increase consumer spending on domestic goods and services. On the contrary, many economists note that a sharp increase in minimum wages will result in job losses. Employers, particularly, small- and medium-sized business owners, are also concerned about situations where increased labor costs could threaten their business.

Source: Minimum Wage Commission & Survey of 60 economists by Seoul Economic Daily (unit: won per hour, %)

Declining Fertility: Changes in Population Structure and Entering an Aged Society

South Korea had the lowest-ever fertility rate last year (2017) of 1.05 birth per woman aged between 15 and 49 over her lifetime. The OECD average is 1.68 (as of 2015). Korea's total fertility rate is the lowest one all over the world except two countries such as Taiwan (Chinese Taipei, 0.89 in 2010) and Hong Kong (0.97 in 2005). In addition, compared to the fertility rates of some East Asian countries such as North Korea, China, and Japan, that of South Korea is relatively low and has been low for years. It is also the first time the number of births in a year has become below 400,000.

Source: World Bank

Figure 5. East Asia Fertility Rates

The declining fertility rate leads to changes in the population structure of Korea, which accelerates the entry into an ‘aged’ society. An ‘aging’ society is known as a society in which 7 percent or higher of its population are aged 65 years or older and an ‘aged’ society is regarded as a society where 14 percent or higher of the population are aged over 65 (World Health Organization, 2011). Korea reached officially this point 2000. In addition, the Elderly (over 65 years) population in Korea outnumbered children under 14 years in 2016. As shown in the figure below, this trend indicates that population aging increases the health care costs for an elderly. Meanwhile, Korea’s elderly overtakes young in the workforce. Consequently, poverty forces over-60s to still keep working, while youths struggle to find jobs during a downturn in the economy.

Source: <https://www.populationpyramid.net>
Figure 6. Population Pyramid of South Korea

social issues: a prolonged recession with a shrinking labor force and generation conflicts. First, drastic decreases in job opportunities for young people and rapid decline in labor forces would bring about a prolonged economic depression. Korea’s seasonally adjusted youth unemployment rate (total % of youth labor force aged 15-24 years old) rose to a climax of 12.5 percent in February 2016. While the total unemployment rate has been steadily increased from 3.2% in 2012 to 3.7% in 2016, the youth unemployment rate has been rising from 7.5% in 2012 to 9.8% in 2016. In particular, the proportion of workable and potential working population (total % of aged less than 64 years old) in Korea has decreased from 89% in 2011 to 86.8% in 2016. In addition, real GDP growth from 2011 to 2017 fell to a standstill: 3.7% in 2011, 2.3% in 2012, 2.9% in 2013, 3.3% in 2014, 2.8% in 2015, 2.8% in 2016, and 3.1% in 2017 (see Figure 7).

Note: GDP growth at chained 2010 year price, seasonally adjusted

Figure 7. Youth Unemployment Rate and GDP Growth 2014-2016

These social phenomena cause two serious

Meanwhile, the change in the population

structure indicates the risk of a generational conflict. Specifically, triggering labor shortages may result in increasingly onerous social welfare liabilities. In other words, since an aging society usually leads to large increases in pension spending (Galasso, 2008), generational conflicts seem to arise surrounding the National Pension system in Korea.

In 2015, the Ministry of Health and Welfare and the National Assembly reached an agreement in which the income replacement rate of the national pension will be raised to 50 percent. This indicates that the current generation of young people will have to pay for additional insurance coverage. Hence, young people in their 20s and 30s vehemently opposed the new agreement.
